BALTIMORE, FRIDAY, MARCH 29, 1822.

No. 1.

AGRICULTURE.

On the preparation of Mortar, by D. Olmsted, Professor of Chemistry and Mineralogy in the University of N. Carolina ; addressed to the Agri-

Presuming that the objects of this Society are sufficiently comprehensive to embrace all subjects appertaining to Rural Economy, I take the liberty to offer a few remarks on the preparation of Lime-Mortar, for building. I have been led to make choice of this subject, from the belief, that the defective and perishable modes of building, common in many parts of our country, are owing, in no small degree, to the imperfections of the mortar that will be offered on the composition of mortar, I have had opportunity to verify by actual experi-ment. To some members of the Society, particularly those who have been much conversant with building, I must apologize for reciting facts, and giving reasons, already familiar to them. The explanations are made as plain as possible, for the sake of those who have not had opportunity to acquire the same information. If any improvements can be suggested in the ordinary modes of making mortar, it is doubtless important that they should be generally known; for it is only in the most ex-

The ancient Romans, who displayed their political wisdom in so many ways, regarded the preparation of mortar of such vast importance to the strength of their architectural works, and the dutheir opulence and power, that they enacted laws their legislators. And what has been the conseperishable by the lapse of two thousand years. The mortar with which their structures of stone The mortar with which their structures of stone or marble were cemented, has acquired a hard-ness which, in many cases, surpasses that of the materials themselves, so that the whole fabric has acquired and or materials themselves, so that the whole fabric has acquired with an equal bulk of water, and kept in a pose a cement, which shall possess all the good proporties environmented with the storyer of class or honorated without the last of the proporties environmented with the storyer of class or honorated without the last of the proporties environmented with the storyer of class or honorated without the last of the proporties environmented with the storyer of class or honorated without the last of the proporties environmented with the storyer of class or honorated without the last of the proporties environmented with the storyer of class or honorated with the sto gained the firmness of a solid rock. Happily, Roman Authors have given us the exact details of the process by which this cement was prepared; but the stopper may be wet by turning the process by which this cement was prepared; but the stopper may be wet by turning the process by which this cement was prepared; but the stopper may be wet by turning the process by which this cement was prepared; but the stopper may be wet by turning the process by which this cement was prepared; but the stopper may be wet by turning the process by which this cement was prepared; but the stopper may be wet by turning the process to the composition of the materials article as it is found in the remnants of their works, indicates that any thing was used in its composition but lime and sand: its excellence must, therefore, have arisen from the quality of these materials, and the perfect manner in which they were united. is lime.

I propose to speak of the chemical principles inhardening of mortar; of the qualities of good mor-

ges that occur in the manufacture of quicklime, would be; and its strength is weakened, and its mortar; but since the white lime will take a larger

Limestone, before it is burnt, is a compound of This difficulty will vanish, when they reflect, that of division; that when it goes into union with a solid substance, as quicklime, those particles that brought, by the force of attraction, so near to each other, as to be reduced into a comparatively small space. On the application of heat, these particles employed. The correctness of most of the remarks are expanded again to their former dimensions, and fly off from the solid in the state of air. These principles enable us to explain what takes place in the conversion of limestone into quicklime. By calcination, the fixed air, which made up forty other hand, when the heat is carried too high, the in its consolidation. of lime, especially for water cement.

> limestone. A mass, say a quarter of a pound, may mode of incorporating them. be put into a blacksmith's forge, and kept at a high heat for an hour. If this mass, when cold, slacks mortar, it is well known, are lime and sand. But on the application of water, we may be sure that it it is plain, that articles very diverse in kind and

and the hardening of mortar, I may be permitted properties are impaired, in proportion to the quanto explain the PRINCIPLES on which these changes tity of this principle absorbed. Hence, in keeping are produced. manufacture of mortar, we ought to use all possiquicklime and fixed air, or what is called by chem-ble means to prevent its combining with fixed air. ists carbonic acid. Some, who have never turned Some of these means, will be noticed as we proceed. cultural Society of North-Carolina.—Read in their attention to subjects of this kind, may find it In Great-Britain, it is deemed a point of so much the Society, and ordered to be printed, Dec. 4, 1821. difficult to conceive, how a species of air can make importance to have the lime, when it is used, pertheir attention to subjects of this kind, may find it In Great-Britain, it is deemed a point of so much a constituent part of a body so solid as limestone. feetly free from carbonic acid, or fixed air, that in the structure of the public works, at Woolwich, it air consists of solid particles in a very minute state is taken hot from the kiln, and used immediately afterwards. But after the mortar is made up, and applied to the purposes for which it was intended, were before separated in the form of air, are then we no longer wish to prevent the lime from absorbing fixed air; for by this means, and by consolidating a portion of water, it returns from the state of quicklime to that of limestone, and resumes the hardness it originally possessed while in the state of massive rock. The hardening of mortar, therefore, depends chiefly on two properties—the power of absorbing fixed air from atmosphere, and of rendering solid a portion of water. Slow dryparts in a hundred of the whole mass, is expelled ing also contributes very much to its ultimate The imperfections of lime not sufficiently burnt, hardness, and time is necessary to enable it to acarise from its still retaining a portion of fixed air, quire its greatest solidity. The unrivalled hardthe substance being partly in the state of lime-ness of the Roman cement is owing, in part, no stone, and partly in the state of quicklime. On the doubt, to the length of time that has been occupied

lime becomes partially vitrified, by which means its qualities are very much impaired. Pure lime adhere readily to the substances to which it is appensive undertakings, and consequently in such as are of rare occurrence, that we can avail ourselves of the skill and experience of the professed archisubstances, requires to be burnt with a lower heat, soft and brittle when dry. When a chimney, for and continued longer than usual. When properly instance, is laid with good cement, the detached burnt, they often constitute some of the best kinds parts, after some time, become united into one mass; so that the whole structure has the same I may be pardoned for digressing here a little firmness as it would have, were it composed of a rability of those structures which they designed from the main subject, to give some rules which single mass of brick or stone; and a wall plaster-for conveying to distant posterity an impression of will enable any one to decide, whether a given ed skilfully, will present a surface almost as firm their opulence and power, that they enacted laws mineral is limestone or not. The different kinds and impenetrable as marble. On the contrary, it are exceedingly various in appearance, but may all be known by one or more simple trials. Lime-detached parts of a structure together, operates to prohibit the use of bad, and to enforce the use of are exceedingly various in appearance, but may is obvious that a cement which does not bind the good mortar. Nor, as we shall see by and by, were all be known by one or more simple trials. Lime detached parts of a structure together, operates their artisans less attentive to the subject than stone is generally of such a degree of hardness as merely by filling up the crevices, while the fabric to be readily scratched with a knife; but it is too has little more stability, than what results from quence? Such parts of their buildings, and other public works, as the despoiling hand of barbarians of any strong acid fall on limestone, it will boil or likewise made of soft or rotten mortar, will be liable to cleave off on every agitation, or even by its is not apt to lead into error. For the acid, oil of own weight; or if it cracks, the aggregate strength

For 75 dollars then, we have a chimney which be admitted until it is as dry as possible. Where mical Catechism, Aiken's Dictionary of Chemiswill not be liable to settle out of its place, which this condition cannot be maintained, a cement of try and Mineralogy, or the American Journal of common lime and sand, will soften and wash away Science; in each, or all of which, particular directions may be found for its preparation.

The Cottager's Manual,

The FOR THE MANAGEMENT OF BEES THROUGHOUT EVERY MONTH OF THE YEAR.

To the president, vice presidents, the treasurer, and members of the British Apiarian Society, who, by their laudable endeavors, have encouraged the culture of the Bee, amongst the cotta-gers, this manual is dedicated, with feelings of the most profound respect, by their secretary.

Before I enter upon the particulars of the prac tical management of Bees, it may be attended with great advantage to the cottager, to receive turns out good for nothing-he has only his own and experience of the engineer. On the coast of England, not far from Plymouth, is a cluster of adding to the common materials a quantity of the the censure upon the animal. Human nature is very dangerous rocks called the Edystone Rocks. metal called manganese. This article would be prone to deception in all cases in which self-interthe extraordinary quantity of honey which causes

Light House built under his direction, has with- have acquired the name of hydraulic lime. An den where it stands, and take particular notice of stood, for more than half a century, the rudest extensive formation of it has lately been discov-the manner in which the Bees of any individual shocks of that stormy coast. Now, rules which ered in the State of New-York, where it is used hive work. As it is probable there may be other we derive from such authorities as this, are surely on a large scale in the construction of the great hives in the garden, the choice is easier to be deered in the State of New-York, where it is used hive work. As it is probable there may be other on a large scale in the construction of the great hives in the garden, the choice is easier to be de-

been, has gained little experience, having never not suppose it improbable that there might be 1—The number of Bees which are seen going tried but one method, and that was taught him du- found among them a kind which would serve for in with the yellow balls, or pellets, attached to

3-The general bustle and activity which are Not having time to point out the particular observed about the hive, and whether the Bees modes of preparing these several species of hy-leave the hive with velocity, taking wing immedidraulic mortar, I beg leave to refer the members ately that they come out—or whether they saunof the Society to the large Encyclopædias, Davy's ter about and then re-enter the hive—the latter is 4-The eagerness with which they appear to time, the majority of the hive are in the fields, hive must then be gently lifted upon it; but here

repel the robbing Bees.

5-The number of Bees which stand at the entrance, fanning with their wings ;-some Bee masters call these Bees the musicians of the Queen's band, as they continually make a hum-it stands, for should it not have been plastered be sacrificed, the hive must therefore be held lev-ming noise; others call them idle Bees, for the down, the Bees will have fastened it themselves. el with the board, and the Bees must be swept same reason as they call a cow idle, who is chewing the cud-both are fulfilling a positive law of nature—and the greater the number of Bees at the entrance, the greater the internal heat, which being occasioned by a crowded population, indicates at once the goodness of the hive.

These may be called the exterior signs of a good hive, as far as relates to the bees themselves; now in regard to the hive itself, some people are very careless and indifferent as to the quality of the hive into which they put their swarms; some will put them into hives, the bands of which are all declares it to be a new hive. Should the combs be entrance, that the Bees may not be suffocated; rotten and decayed, and which are consequently the receptacle of those very insects and vermin which fallibly an old one. are so prejudicial to Bees; others will take no care as to the dryness of the hive, which is an essential point to be attended to, for if the hive be damp, the noxious influence is communicated to the combs, and they become soon spoiled. A swarm ought always to be put into a new hive, well seasoned, and lightly made; were this advice always attended to, we should not witness so many disastrous failures which annually occur in the management of Bees. Never select a stock the hive of which appears to be rotten-if a swarm of the current year has been put into it, the hive will soon destroy the Bees-and if the Bees in it are as experienced person can immediately distinguish old as the hive itself, it is not worth the trouble of the different odours which proceed from a hive. removing, much less of paying for it. In an old hive, the chances are a hundred to one against you, upon the board of the hive, it would not be prubut that it has been the breeding place of the dent to purchase it, for it is certain that the Bees moths, the eggs of which afterwards hatching by are afflicted with the dysentery. the heat of the hive, produce the caterpillars which in a week will destroy a whole hive.

a good hive, I will proceed to the interior, and here the greatest difficulty presents itself to the hive; and if amongst those particles some small young practitioner. Most people entertain a most grubs are perceptible, with a reddish head, you ungrounded fear of Bees, and deem it almost mad-may condemn the hive as good for nothing, for it ness to turn up a hive to inspect it. Now, I wish will not last two months longer.

(To be continued.)

* The necessity of minutely attending to this advice will be apparent from the following circumstance. I once purchased a hive of an indigent woman, who was obliged to leave her cottage, and I procured a man to remove it for me, who carried it upon his head. I thought we had stopped up every hole through which a Bee could escape, but it being a very old hive, I soon found I was mistaken, for we had not proceeded far, before two Bees made an attack upon the man's ear, who, not much relishing his new acquaintance, threw down the hive without any further ceremo-

British Farmer's Distress.

The general distress that has prevailed since

AGRICULTURAL EVIDENCE.

There are two or three points connected with the evidence on the Agricultural Report, upon which we deem it of some utility to make a few ground, exactly in the front of the hive, and the observations, inasmuch as our own personal experience has manifested to us, that very incorrect and confused notions still exist upon these subpay for its tillage, even exclusive of any rent ;the committee of the charges and expenditure of farmers in the ordinary course ;-and the fourth and last, the confirmation of our often repeated of old Gaul." Matters went on very smoothly the Bees, occasioned by the dysentery—from the tural leaning towards the farmers, from the memowith us for some time, until about twenty or thirty corrupted brood—or from an unusual quant ty of ry of our early life, we consider ourselves in treatBees had found their way up the legs of the unsusBee-bread, which is always found in old hives.—

than any of our cotemporary papers, inasmuch as, with which we happen to be as well acquaintin the two periods of our early and later life, we ed as with the metropolis in which we are have necessarily become acquainted with the cir- writing. The mere expense of cultivating this cumstances of both conditions. Add to this, that acre, breaking it up from a three years old

1800, and 1814, and in 1821, a one pound note or mer to do the whole work for us, and of course a five pound note was always exchangeable for pay him a profit price, beyond his own cost in lathe same value of silver, namely, for twenty or an bor and horse work. Add four shillings for tithe, hundred shillings; and as their current value was and four and sixpence for rates (which are the acthus always the same, how they demand, can you tual charge,) and the sum total of the expense of assert their depreciation? In the first place, this tillage is three pounds 13 shillings. Now what allegation is not true in the degree in which it is is the produce of this acre? The produce of the taken; for such notes were never so changeable, land in our eye, which happens to be good land, except where, from favor, or some external pro-fit, people were obliged so to change them. One sake of fairness we will take it at three quarters or two or three notes might have been so exchang- and a half, which is nearly the average of the ed; but what money broker would have changed county through. The price of these three quarforty, fifty, or an hundred, at their par in bullion? ters and a half, at three pounds the quarter, would The fact, therefore, is not so. But, to cut short be ten pounds, ten shillings; that is to say, an the argument, allow it to be so; and to what more increase of six pounds, seven or eight shillings, will it amount, except that paper money had not de- above the actual cost in tillage. It is true this is preciated in its exchange and dealings for silver? only upon the single acre; but this is enough to But this is only one of the articles for which it is exchanged in the daily business of life. Compare the not pay its tillage, which returns in the most care-£5 note in 1790 and the £5 note in 1812, with less and expensive cultivation (using hired work the different quantity of any goods it would com- and horses instead of your own) ten pounds for mand in the two periods. In 1790, we have seen a three. In a word, the land, the corn, the climate, quarter [8 bushels] of corn sold at forty-two shil- are the same now as in the days of our fathers, exlings, its current and ordinary price at that day. cept that the productive powers of the soil are In 1814 and 1821 it would have taken the five very nearly doubled in the county of which we are pound note to purchase the same quantity. Eighty shillings, in short, five years hence, was what forty shillings were in our earlier life. In other words, the same sum of money now commands one half of are necessarily limited; they cannot exceed what it purchased then, that is to say, prices have a tenth; and where (let us speak fairly) do they risen and money has depreciated in that proportion. amount even to a fifteenth? But because taxes— The error and confusion arise in imagining that we here speak only of paper money, as if the de-preciation were in the Bank note only, as compared with bullion money. But this is not the meaning of the proposition, that prices have risen from farms in the year 1793 and 4. But then poor rates the depreciation of money. The meaning is, that

—Why, as to poor rates, the matter stands thus: from the abundance of money of all kind, paper in 1790, the rate was half a crown an acre; and in and coin, during the long war, the value of money had so fallen in currency, that it required twofold difference of seven pounds, ten shillings on the the same quantity of money to represent the same hundred acres. Do you mean to deny then, that value, or to speak less technically, money was so the farmers are dreadfully oppressed? Certainly plentiful, and buyers so rich, that prices universal- not: we mean only to assert, that the grievance is y doubled. This is what is to be understood by the less in tithes, rates, and taxes, or in any increased depreciation of money, and not any depreciation of expense of cultivating the land, than in what the Bank of England paper, as compared with bullion. The depreciation of the Bank paper was very triffing, and as respected our internal cur-committee, under the apprehension of their rerency, scarcely perceptible. The true deprecia-tion is in the whole mass of money circulating through the kingdom, whether in coin or in bullion, but which mass was augmented in quantity by the accommodation system resulting from paper issues, as to render every component part of agents dependant upon themselves and capitalists, the whole of a proportionate less value. The and in many instances, landlords themselves, they guinea itself in fact was nearly as much de- had called up a few practical men, who, with a due preciated as the Bank note. This must be constantly borne in mind, in order to have a clear conception of what is to be understood by the depreciation of money.

As respects the second point, that land can pay no rent, and is not worth its tillage, where the farno rent, and is not worth its tillage, where the far-mer has no rent to pay, it would seem almost too the expense of seed and tillage, exclusive of rent dry state, is very slow in springing up, and the absurd to require an argument; yet does every are, at the present prices, about two pounds, ten weeds generally get much ahead before the carpage of the evidence make this assertion, and shillings per acre, the farm through. Now, if the some of the witnesses even adduce whole columns landlord will take two pounds, or even thirty-two to prevent being pulled up with the weeds. of figures to prove it. It would not be fair, in an shillings of this two pounds ten, for his rent, the ordinary case, to examine the expenses of a farm farmer can certainly only hardly live, if he can entirely on early attention and thinning, weeding by those of an acre of arable land; but under pre-live on the small remainder, and can lay aside no-sent circumstances, one extreme is best met by thing of those profits to which he is fairly entitled. crop nearer than 3 or 4 inches, and should at all another. Now we will take an acre of land from This is the cause of the present distress. Rents times be kept free from weeds, and the earth

to the question with so many more advantages before our own door, in a part of the country are, even in these counties, at thirty shillings, question either way, except as our individual in-rowings, sowing, dung and seed; in short, the terest is involved in that of the country in general. As regards the first of these points, the difficulty with plain understandings is this, that in 1793, in three guineas, tho we were to hire any small farspeaking, by skilful culture; and therefore, why, Mr. Curwen, should not the land still pay for its tillage? Because tithes are so high—But tithes We know not how it may be with you; but we have farms in our eye, of four and five hundred acres, which in this current year, 1821, do not pay twenty pounds more than was paid on the same the current year it is four shillings, that is to say, a you landlords most studiously conceal, and in what ed, and all the seed were good. the farmers themselves examined before the spective landlords concealed too. We will in-form you where the grievance lies-it lies in the high rents. We speak what we know, and what we would have asserted in favor of the farmers before the committee. If, instead of examining only land respect for the committee, but without any circumstance which should clap a muzzle on their mouth, would have shown them the question in its true shape, they would have known that this was the cause. The returns of farming in Norfolk

where they ought to be at twenty; and instead of reducing, permanently reducing the rent, the present practice is to take it in full, and then give a portion back, still reserving the same rent on the we have not a sixpence of peculiar interest in the grass lay, for wheat, three ploughings, har-lease. But who can go on in this way? As farmers, we would not.

-0-Culture of Carrots.

TO THE EDITOR OF THE AMERICAN FARMER. Roxbury, March 10th, 1822.

In compliance with your request for my mode of cultivating and preserving carrots through the winter, I now enclose you the same-although, asa treasurer of the Massachusetts Agricultural Sos ciety, I have paid premiums for much larger crop than my own, where much more labor and manure was made use of, s you will see by referring to our Repository, of Oct. 1817, 1819, and 1820, when striving for premiums.

I am, Dear Sir, your's respectfully JOHN PRINCE.

For One Acre.

I always cultivate carrots on the deepest loamy soil, that has been previously under some hard crop for one or two years-then as early as your soil is fit, plough it as deep as the implement with a strong team will carry it; in a few days harrow it, and plough again to make it as fine as possible, and between the 20th May and 10th lune, spread on 20 or 30 ox cart loads of about 30 to 35 bushels each of fine, old manure, and plough it in lightly, and harrow thoroughly, so as to be well mixed with the soil, and then brush, harrow and level it—if on a side hill, be careful not to have the rows up and down, as they are apt to wash, and by which I nearly lost my last crop; the field in which they were having a great ma-ny fruit trees, made it inconvenient having them any other way. The seed should be sown as soon as possible after levelling the surface.

Seed and Preparation. I have always used for field culture the common orange carrot, and the seed should be thoroughly rubbed and winnowed, till all the rough edges are off, and finally made as clean as parsley-seed-then take about 11 lb. and add warm water to make it fully wet, and turn it over occasionally for two or three days, till it swells and is on the point of sprouting; then mix with it hae a bushel of dry wood ashes, which allows it to be sown more freely and even; 1/2 a pound would ban abundance if it could be sown as soon as wish

Sowing, &c.

I have generally used the Northumberland turnip drill-any other machine may answer as well; only gauge it accurately, so that it be evenly sown, or it may be done by hand-we sometimes sow it in rows, three feet apart, if it is intended afterwards to sow Ruta Baga, Mangel Wurtzel, &c. &c. between it-but if alone, I should recommend 13 to 15 inches from row to row-the seed should be covered, and pressed down by the feet in following the machine, or by a light roller, (which I think important for almost all seeds)—and by treating the seed as be-fore described, it vegetates and gets over the surface before the weeds, and is much more easily

Success in cultivating this vegetable, depends

Harvesting and Preserving in the winter. Carrots grow more in October than any previous month-the first of November is early enough to gather them; my method has been to cut off the tops near, but not quite to the crown of the plant, with sharp hoes; they are greedily eaten by oxen, cows, sheep, or swine-then run a plough deep, drawn by a pair of oxen or horses, as close to a row as can be directed, and down by another row a rod or two off, when they are seen standing think more than half the labor is saved and the earth is left in good order for the next season. I have other roots in pits, prepared as follows:—Dig the than truth in Virgil, many trees which claimearth about one foot deep and four feet wide, of ed kin when he wrote, disown it now. According earth about one foot deep and four feet wide, of any length you please (but I should recommend not more than 150 or 200 bushels to be kept in one this ground, and pile them up about 3½ feet high—
they should then be covered six to twelve inches
with straw, meadow hay, or any such refuse article, and to be as nearthey should then be covered six to twelve inches
with straw, meadow hay, or any such refuse article, and to be as nearthey should then be covered six to twelve inches
the opportunity, owe it to philosophy to make the
experiment. There is something sublime in the
swell.

No other instrument is required than a sharp more, till finally it may be eight to twelve inches thick, which is enough for our most severe win-citing exertion, should expel his inborn apathy an inch with the knife, cut off a bit of the twig to ters—(as such a body of vegetables of themselves so fatal to his happiness and glory. All the in-produce much heat,) they are more likely to be structions I have ever seen on grafting, I know to having one edge thicker than the other, fit very injured by being too warm, and especially when be very imperfect. The old bungling method of apfirst put up. I have had them live in the ground plying three or four pounds of clay and stonewhere they grew, through the winter as well as parsnips. By the above management, I think 500 to 700 bushels per acre may be calculated onand we have paid premiums for 960 bushels, where I presume no more pains were bestowed.

FOR THE AMERICAN FARMER.

FRUIT TREES.

-

Edgefield, South Carolina, Feb. 28, 1822. " On Savage stocks inserted learn to bear."

There are few subjects more deserving the atgrafting, and few which are more unaccountably neglected. Not only to natural philosophers, but to whomsoever the works of naturalists can impart a charm; it must be pleasing to know some-thing of that affinity in the saps of different trees, which qualifies one to bear the fruits of many however widely differing in shape, size, and flavor. Thus every variety of plum, peach, nectarine, apricot, and almond will succeed well on the wild plum stock. The apple, pear, quince, medlar, service, and hawthorn, tho differing with one another, will all agree to grow on the hawthorn, The whole of the Icosandria class (cratægus.) appears to discover a disposition to graft on each other. It seems somewhat derogatory to the periments to ascertain the best composition for a character of American husbandry, that the third volume of the Farmer is nearly completed, and nothing like a lecture has yet appeared, upon an art, so productive of profit and pleasure. However desirable, I do not presume on the present occasion, to supply the deficiency here complained of.
The very short time since my attention has been directed to the subject, forbids it; but my zeal in the cause, prompts me to begin, what I hope to see completed by an abler hand. Faith and philosophy appear to agree in the simplicity of the origin of all things.* From these premises we

loosened with a hoe—(a Dutch scuffling hoe is might conclude, that previous to all changes by active useful)—most of the labor after sowing may be observed by cident or culture, all the fruits of earth might have the noviciate in the science of grafting. All trees better be performed by children than men.

The following general rule may be observed by cident or culture, all the fruits of earth might have the noviciate in the science of grafting. All trees flourished on one parent stock! Culture seems to As the apple and pear, apple and quince, cherry and plum, and even the wild and tame cherry, will not graft together, although of the same genus; while the apple and nawthorn, peach and rose will succeed together, by grafting. And I have been informed by practical grafters, that many varieties of cultivated apples refuse to grow on the wild crab stock. Philip Miller speaks of the wild cherry as a stock for the tame, but there must be a since his time, as I can assert from repeated trials, both by budding and grafting, that an union cannot succeeded perfectly in keeping them, as well as all be effected. And if there be not more of poetry to this view of the matter, in the ratio that the different genera of trees recede from their original hean) and on a dry situation, or a deep trench should condition, will be the difficulty of uniting them by out, put on, only enough at first to keep down the fruits of the earth in their crude state, to be melstraw-and as the cold weather increases, add lowed by the hand of man; that in effecting this ration; a warm moist day should be preferred. salutary change, the conceit of his skill, by inhorse dung to the grafts, should have been long ago exploded.* The sole intention of a wrapper being to exclude the air from the wounds occasioned by the process, a cerate will answer the purpose far better, cheaper and neater; a piece progress in uniting with the stocks, the wax may be collected for future operations.

Almost every publication which I have had the opportunity to peruse, directs one third of turpentine in the composition; of a grafting wax, this though very ductile and pleasant to use, I found certainly to destroy both grafts and stocks, as far as ention of the American agriculturist than the art of the wax came in contact with them. From the numerous respectable authorities recommending this wax, I was very liberal in its application to a number of choice grafts, without suspicion; but had the vexation upon the first inspection by removing the wax, to discover that a complete mortification had taken place under the wax; and even extending further in little lines along the grain of the wood. I separated the dead wood, and with a more friendly cerate, regrafted the surviving buds with success. Whatever may be that both grafts and stocks should at all times the innocence of a wax containing one third turpentine in a northern climate, I was so well convinced from my trials of its deleterious effects in Carolina, as to reject it entirely. 'After many exgrafting wax, I prefer the following:—One measure of olive oil or hog's lard, 3 do. of melted bee's wax; mix well while hot, to be worked after it is cool, till sufficiently pliant. Perhaps sweet gum resin might form the basis of a more ductile wax, without imparting a destructive quality .-

have full as much influence as difference of genus. succeed together by inoculation. Those who have the opportunity and inclination to indulge in speculations on the production of vegetable hybrids* should try trees of the same class and order, or if differing in this particular, such as discover a similarity in the fruit, leaf, or sensible properties of the sap and wood, &c. Grafting is performed by making an operation upon the wood of the stock, to which is attached the cut of a twig from another tree, both wood and bark, with an indefivery regularly, and are easily pulled by boys and difference between his variety and that of this nite number of buds.† Though March and April thrown in heaps till carted off; by this method I country; or a further change has taken place are the usual months for grafting, it may be protracted till May, and even June, perhaps with better success than earlier; by keeping the grafts in a degree of moisture which will just prevent their withering. The stocks should not exceed the size of a large goose-quill, but if they are old, select limbs of the same size; if there be none, head down the stock and wait till they come; the grafts will be more neat and valuable for the delay. The twigs be dug around the heap, at a small distance from at to keep off the water—then lay the roots on will not graft together, perhaps the wild apple and ble, from a young healthy tree, and to be as near-

> knife, with sufficient strength to perform the ope-Cut the stock off even and smooth, split about half exactly the edges of the wood on the thick side. Then cover as much of the graft and stock as was wounded in the operation, with as much grafting wax as will exclude the air. There are other methods of grafting in the wood, but the method here laid down being the most simple and certain of success, I think it useless to describe any other. the size of a hazel nut being generally sufficient. But the season of grafting is somewhat short and And after the grafts have made some little precious, whilst that of budding is lasting and very certain. Moreover, many trees will bud perfectly well, which will not graft at all; as the mul-berry, &c. Budding or inoculation is the very simple art of ingrafting one tree on another; by making an incision through the bark only of the stock, sufficient to make bare a small surface of the wood; while a little strip of bark contain-ing a single bud of a size corresponding with the incision made on the stock, is fitted exactly and speedily on the spot of wood deprived of its original bark. Although midsummer is the usual time allotted for budding, it may be performed with success from the first of May, till the last of September, or even later. I think I have succeeded better in September than any month with such buds as had a sufficiency of sap to peal freely. And to insure success, I will here remark,

own stock: but these are the mistakes of great men. I don't believe there is any tree that will bud more

Let the theorising orchardist who is fearful of a summer pruning, (because his books nor father's been informed of another instance in the same dison stocks hardy and mature, capable of affording have not told him of it,) recollect what is the trict; and I have myself very luxuriant grafts as much fruit in two or three years as the seed consequence of breaking a riding switch, or half on the parsley leaved hawthorn, which produced the boughs of a tree being torn off by weight of truit, or other accident. Whether is death the result, or a sudden production of numerous thriving shoots, in some cases gay flowers? By the by, I think the growing season the proper time they controlled by the theories and conceits of graft. 228 flower buds.

In the spring of 1821, I transplanted some wild flum stocks, from 2 to 3 inches diameter, close pruving shoots, in some cases gay flowers? By the twee they controlled by the theories and conceits of I counted, in the fall of the same year, on a single graft. 228 flower buds. graft, 228 flower buds.

ny, from our present imperfect knowledge of grafting and the hardy hybrids producible thereby, but that trees, destined to eternal barrenness, may be burthened with the produce of the palm, the olive, or the bread fruit tree? We have seen the peach "blossom as the rose;" and with our present this, he very fairly offers to others an opportunity knowledge of the principles of ingrafting, it is practicable for every moderate farmer, by devoting to the exercise of this art, the time he is wont to the exercise of this art, the time he is wont to the exercise of this art, the time he is wont to the exercise of this art, the time he is wont to the exercise of the principles of to the exercise of this art, the time he is wont to their own neighbourhoods. sacrifice to inglorious sloth, or criminal amusements; to create a paradise of fruits and flowers, where thorns and briars now grow but to curse his land.

This communication has spun out to a much greater length than I intended, at the commencement; but in the progress I thought, as encyclopedias and dictionaries of arts and sciences, &c. were not accessible to all your readers, it might not be amiss to describe the processes at length. However, if you find fault of the length, you can prune the superfluous shoots, or make any dispo-

sition of it you think proper.

I will trespass no further on your patience, than to wish you all the success your zeal has merited. ABNER LANDRUM.

FOR THE AMERICAN FARMER.

Mr. Skinner,

Dear Sir,-I have observed in the American Farmer, Number forty-seven, an enquiry made by a Virginia farmer, for information as to the best means of preventing hogs from being in-

when they are infected.

The means I use is nothing more than a little tar and grease of any kind, sufficient to make the tar quite thin, then pour it over the hogs when fed, sufficiently, so as to have them well smeared with the tar; this may be repeated often in the sum-mer and fall, as I conceive it to be an excellent thing for the health of the hogs-or in good weather, you may give each hog a small table spoonful of sulphur in their food, or in damp weather, have them well sprinkled with strong wood ashes; either of these remedies will prevent or destroy the vermin.

Your's, very respectfully, JOSEPH W. BALLARD. Mount Pleasant, Isle of Wight County, Va. \\

water be placed in the vicinity of the hives. It the prudence and skill of the proprietor must be will, however, sometimes happen, that the water put to the test, according as the circumstances have become so completely reconciled with my placed on the preceding night, will be found, at arise. this season of the year, frozen in the morning; this

MARCH.

The beginning of this month is the proper time for extracting from the Huish Hive, any infected combs which may be perceptible in it; the method of which is so fully and minutely detailed in the " Instructions for the Use and Management of the Huish Hive," that a description of it here, would eggs, some judgment is necessary in regard to flight into the fields. those combs, in which she may have deposited the few eggs of the season—the Queen does not run from comb to comb to deposit her eggs, but hav-ing commenced the laying in one comb, she proceeds from cell to cell, until every one contains an egg-and she generally begins in the middle of a comb: In taking out a comb, therefore, particular attention must be paid to discover if any eggs have been deposited in the cells, and if any be found, the comb should be returned, and not meddled with again until the close of the season, when

it should be taken away altogether.

Some hives may be found this month in a very to vigilance and activity. The Bees will dwin-dle away by degrees, until the hive becomes whol-ly abandoned. This is an infallible sign of the affording equal light. barrenness of the Queen, or that the hive is wholly divested of any fecundated eggs of the preceding season—in this case, the proprietor should immediately proceed to join the Bees to the weakest stock hive in the apiary. If the Bees be in a Huish Hive, the operation is very simple. Take off the which was applied, might be more easily put on by the to which the Bees are to be joined, and place the other hive on the bars; then procure some dry leaves or tobacco, and give the Bees of both hives a slight fumigation—plaster the uppermost hive a slight fumigation—plaster the uppermost hive except through the entrance of the lower hive.

The size of the candles were about six to the informed, for twelve dollars and fifty cents per thousand—they are "bulky," and stow badly, consequently a vessel will carry but few, and the straw, and made round, so that the coat of cotton, which was applied, might be more easily put on by rolling the stick upon a card which contained the cotton, which had been previously well carded. The stick was then rolled upon a table, to cause the cotton to adhere closely, and then was about a slight fumigation—plaster the uppermost hive must be somewhat longer than the mould, as the stock provided to keep them from the bars; then procure some dry leaves or tobacco, and give the Bees of both hives a slight fumigation—plaster the uppermost hive must be somewhat longer than the mould, as the stakes should be set about two feet in the ground, and place to twenty-five dollars. They are light and they are "bulky," and stow badly, consequently a vessel will carry but few, and the freight is high. The price of such rails here, a distance only of about twenty miles, is from eight them. They are light and to the upright stakes, pinned at the top,* and the part of the procure of the stakes should be set about two feet in the upright stakes, pinned at the top,* and the part of the procure of the stakes should be stakes shou barrenness of the Queen, or that the hive is wholdays the massacre of one of the Queen Bees will Agreeably to the foregoing experiment, a pound rot off, which I am informed will be in about five have taken place, and the united assembly will of candles will last forty-two hours, when they were a conformal will be in about five then begin to work as one formily. Should be a conformal will be in about five the property of the pro have taken place, and the united assembly will of candles will last forty-two hours, when they then begin to work as one family. Should the Bees would only last thirty, made after the usual way be in a common hive, the operation is more difficult, and is attended with those obstructions which cult, and is attended with those obstructions which deter many persons from attempting it. The top of the hive to which the Bees are to be joined must be cut off, and the combs laid bare; this, however, it be so easily affected by the air. be cut off, and the combs laid bare; this, however, it be so easily affected by the air.
is no easy task, as the combs are all attached to If you think proper to give the above to the must then be placed upon it, and plastered round from the use of wooden wicks, generally. the bottom—the same system of fumigation must be adopted as with the Huish Hive—and the benefit of the union will soon be perceptible, from the 1st vol. of the Domestic Encyclopædia, called ten fect, but are about ten and an half—the smallest are selected and put at the bottom, others.

W. B. increased activity of the Bees:

In the feeding of the weaker hives, particular

This month the tin sliders may be drawn away from the entrance, and the Bees may have the centinel to an army, in an enemy's country. Should the situation of the apiary not offer the advantage of its full extent, providing about ten thousand ten feet juniper indispensable requisite of water, the bee-mastime against those casualties, from which the apiarity of the bives are that troughs of any is never exempt, but in the regulation of which, a thorough examination and repair, in which is a thorough examination and repair, in which is Should the situation of the apiary not offer the advantage of its full extent; providing at the same

This is a good month for the purchase of stock water should be immediately removed, as melted hives—as they have weathered all the casualties former owner of this farm was induced, about ice is highly injurious to the Bees.

of the winter, and little fear need now be enter-twenty-five or six years since, to try the "post and" tained of famine.

The warmer the hives are now kept, the better, as it accelerates the hatching of the eggs, and promotes the prolific nature of the Queen. Some young Bees may now be perceived in the hives, and they are told by being of a greyish color, and are seen running about in front of the hive-the be considered superfluous. Some Queens, how-old Bees will be seen cleaning them with their ever, being more early than others in laying their proboscis, and in a few minutes they will take their proboscis, and in a few minutes they will take their

ON THE USE OF JUNIPER RAILS. STEVENSON'S POINT, Perquimans County, V. C. March 7th, 1822.

Dear Sir-It is my misfortune, perhaps, to be good fence or hedge I look upon as important, comparatively speaking, to an agriculturist, as a strongly walled city to the besieged, or a faithful

This winter I have met with an opportunity of purchasing about ten thousand ten feet juniper purchase of rails, that, for the future, I now think, I shall purchase none but of that description. The twenty-five or six years since, to try the "post and railed" fence, with double ditches, and for that purpose procured a quantity of juniper rails. The fence upon that plan, not answering his expectations, as I am informed, inasmuch as the hogs broke through or undermined it, he pulled it down, and used the rails in the ordinary way. Now, sir, to my surprise, at this time, after a use of twentyfive years, at least twenty of which, this farm has been rented or leased out, I find these rails nearly as sound and firm as they must have been the day they were put in use! Many have the bark on them, apparently as fresh as ever, and but few in a state of decay! And to this, sir, permit me to add, that I am informed, there are rails of this description, in an adjoining county to this, which have been in use for sixty years, and are yet faithful, though venerable, centinels! The intelligent farmer will, at once, perceive the many advantages. SIR-I have taken the liberty of enclosing you derived from a fence of this kind : there is the ex-

Ten feet juniper rails are purchased in the county of Tyrell, delivered on the water, as I am The size of the candles were about six to the informed, for twelve dollars and fifty cents per

I am, sir, your constant reader, and

very humble servant, JON'A. H. JACOCKS.

* My fence, upon this plan, stood the late September storm, and was the only fence on the plan-The idea is not original with me, but derived tation that was not taid prostrate. The rails are wise pigs might find their way through.

A neighbor of ours, a good practical farmer, into any part of the slope GC, it would bring a when a very full color is intended, is four ounces Joseph Delaplane, has, since last fall, made trial way either dust, or a clod nearly as hard as a sun-of alum and two of tartar to each pound weight then the tartar by small quantities at a time

This proportion of mordant is too large for No doubt the intelligent readers of the Ameri-can Farmer have often observed similar facts—the ficient, and the tartar, should never exceed the ratio of one-third of the alum. An effervescence cannot be produced unless the water contain some carbonate, which is generally carbonate of lime.

P. 6. "If the water meant to be employed, be foul or hard, and not fit for washing, or curdles soap, it is not fit for dying bright colors. This defect may be remedied by boiling bran, &c. in it; but no bright color can be obtained from foul

It is a fact well known by the best English dyers, that water holding the carbonate of lime in solution, which is not fit for washing, and will curdle soap, is the best for dying bright colors, such as scarlet, buff, orange, &c. &c. Foul water is never used for bright colors, nor can it be remedied by using any glutinous substance.

The property of water has more to do with dying, than is generally imagined. This subject would afford an extensive essay; but my observations must necessarily be confined to a statement of a few facts, which I hope will throw some light on the subject.

The dyers in the county of Gloucester, are more celebrated for coloring scarlet and black brated for the same colors. The water in the carbonate of lime; so much so, that twigs laid in the streams will soon become thickly encrusted with it; and a violent effervescence is produced, when a mordant containing an excess of acid 's thrown into the boiling dye liquors. In all aceach other will produce the same shade of color, from a like proportion of the same materials .proceed to collect extracts, and show wherein they are erroneous. It will be understood that produced by water from the same stream, when

> There is a locality in the practice of dying, arising from the variable properties of water, which accounts for the various receipts given by different writers, to produce the same color. I knew a dyer who commenced business in one county and failed; he then removed to an adjoining county, and became highly celebrated. After maintaining his reputation undiminished for thirty years, he returned to the county he had originally left, where he again lost his creditnor could he there maintain the reputation of a common dver.

When water is more or less impregnated with limestone, the effects produced by the mordants on coloring matter will be very different, than in water containing none, which will be evident cess of acid will combine with the lime, and a mordants remaining in the liquor, will be tareven diminished in vigor. If a tool were stricken stances in the preparation liquor, for woollens, trate of lime, tartrate of pot-ash and pot-ash. If

sult will be sulphate of lime and an oxyde of pounds eight ounces of lac-dye, six pounds eight iron, and changes will be produced more or less on every mordant used. When pure water is employed, none of these changes can take place. employed, none of these changes can take place. flower; when these ingredients are well stirred from drought, and then come up well. This, how-With a knowledge of these facts, and also, that in, add to the mixture four ounces of diluted suldifferent waters contain different alkaline earths and oxydes in solution, in innumerable proportions, we shall no longer be surprised at the variety of receipts given by different artists to produce the same color.

P. 8. "In extracting the colors of many coloring drugs, as yellow and red, it seems to me, that a full boiling heat ought to be avoided .-Hence I should approve of the method employed in the English dyehouses, on the recommendation of Count Rumford, of boiling by steam."

The heat of steam is used by very few of the English dyers, and where used, is done from a principle of economy, not from an idea of dying below a boiling heat. Madder reds are never boiled, because the yellow of the madder, which can be imbibed only at a boiling heat, injures the color. There are but few colors that the this dreadful malady, the rot, and suffered considpores of wollen will absorb below a boiling heat; and yellows require a strong boiling .-Steam heat will answer in some colors, but in the greater number it will not, for scarlet and many others that have been tried by steam were found to have only an external coloring. Hence the reason why those who use steam, have a grate under each furnace, to be made use of

P. 16. "Nicaragua, Peach, Cam, and Bar woods. These are now imported, and used as very inferior and cheap substitutes for Brazille and Crazitutto. It would be well worth while to make a set of comparative experiments, as to the quality and brightness of coloring matter they contain, for the purpose of ascertaining their re-lative value. The nitro-muriat of tin should be the precipitant for these woods."

Cam and Bar woods, produce colors of a very different kind, from Brazille wood, and are much more permanent, therefore, their relative value cannot be expressed, by any comparison of the proportion of their precipitates. Neither can an abundant precipitate be always considered as a proof of superiority, for it is often only apparent, and is owing to a feculent matter, which adheres to the acid, and is carried down with the preci-

P. 17. "Stick lac: seed lac: shell lac. The red colouring matter of the resin lacca, is very frequently used as a dying material on the contineut of Europe; but in England, I believe lac is only used for sealing-wax, and black paper var-

nish.'5
The coloring matter of shell-lac, has been used in England about fourteen years, as a substitute for cochineal. It is extracted in the East Indies, and precipitated with muriate of tin; from whence it is imported in square cakes, and the best quality has been sold at about half the price of cochineal.

I discovered the process, by which scarlet could be coloured from lac lake, in the year 1807; and entered a caveat with intention to secure a patent right. But on leaving the country the fol-lowing year, I gave up all idea of reaping any ad-vantage from the discovery. The following is the process, now followed, to color scarlet with the lac-dye, which I have lately obtained from Eng-

First. A lac spirit must be prepared, by dissolving four ounces of tin in each pint of muriatic acid; which must be done by digesting the mix-ture in a sand heat. This is called the lac spirit. must be prepared in a sand heat also; take ten where the precaution may have been used. Nor portions of the several ingredients employed, and

ounces of cream of tartar, four ounces of tumeric, eight ounces of cochineal, and one pound of safphuric acid. It must now be well stirred for one hour, and let it remain in the sand heat, until the following morning. To dve a scarlet, one pound of the compost is used to two pounds of woollen.

HOPSON.

200 ON THE ROT IN THE GREEN SEED COTTON.

Charleston, S. C. Feb. 8th, 1822.

DEAR SIR,

Should you deem the following observations on the rot in green seed or upland cotton, worthy of a

In the year 1818, my cotton was first visited by erably. From frequent conversations with several intelligent and observant planters, I became convinced, that the injury was caused by an insect's puncturing the pod, and most probably for the purpose of depositing its egg, which might be proof rich land contiguous to my dwelling house. Earsmall quantity at a time, and stirred, so as to sepa-rate them. They were allowed to steep about 20 quantity of lime, until each seed was completely covered. On the 25th of March, the field was planted (immediately after the seed was rolled) Towards autumn I perceived a little rot among it lition towards the close. The produce, when gathered in, was kept separate from all other cotton, and yielded 285 lbs. of clean good cotton per acre. I mention this, to shew ner, with the exception of raking up the fallen pod, fered rot very materially. had more rot this year, but very far less than my neighbors. I have, however, abandoned the culture of the green for that of the black seed cotton, (from its dreadful effects in the lower country) which is free from this evil; and, although I have observed the small dark speck (which is the incipient stage of rot with green seed) upon the pods, t appears to have done no harm, from the pod being probably of a firmer and more impenetrable texture.

I am of opinion, that if this plan was tried throughout a neighborhood generally, the disastrous ef-

the sulphate of iron be the mordant used, the re- pounds of the lac spirit, in which dissolve six can I affirm, that very strong ley may not injure the germinating of the seed; but, with such as I have tried, I know that it will not; as I have had seed to remain in the ground for several weeks ever, can be tried on a small scale, by placing the seed so prepared, in a warm place, before the sowing of the crop generally. The cultivating of green seed cotton being altogether given up, in the part of the country in which I reside, I shall renew my experiment this year-and, should it be attended with the success anticipated, will feel much happiness in communicating it.

From the Archieves of Useful Knowledge.

To Make Soft Soap.

Take five bushels of ashes, damp them the place in your truly useful paper, I beg you will give them an insertion, and oblige one of your subscribers from South Carolina.

roughly on the ground, and let them stand from five hours to two days, as may be convenient; then make up the heap in an oblong form, open the middle, and put in three pecks of perfectly fresh lime, and sprinkle about three or four quarts of water over it, and cover up: observe to use hot water in very cold weather. In large experi-

ments, cold water will answer in any weather.

In half an hour, the lime will heat, and burst open the heap of ashes, when the whole must be tected through the winter, by the woolly fibres well and quickly mixed, and put into the ley tub, which adhere to the seed. In 1819, I tried the to the depth of one foot, and beaten moderately; following experiment, particularly on a small field another layer of ashes, of the same depth as the first, is then to be added and beaten as before, ly in the winter I had the stalks collected and and so on until the tub it filled within six inches burnt; and finding that many pods, destroyed by of the top; water is then to be poured in steadily rot, had fallen off and were lying about the field, until the ashes are nearly or entirely spent. The I had them carefully raked up and burnt. A few ley must be of a strength scarcely sufficient to days before sowing, I had several casks got, in each float a newly laid egg: four gallons of this ley are of which were put about one bushel of ashes to to be put into a large kettle, and thirty or forty about twenty gallons of water, taken from a manure pounds of fat added, and well stirred, over a genheap, and a gallon or two of pickle, which had been the heat. When it is perceived, that the sharp used for curing meat during the winter. The mix- taste of the mixture is lost, more ley is to be adture being well stirred, was allowed to stand for ded occasionally, until the soap becomes transpa-24 hours—the seed was then put in carefully, a rent and very thick, and toward the last of the operation the liquid must be made to boil briskly. When the soap is made, let it stand for a day; hours, and then rolled in ashes, mixed with a small when, if it does not grow thin, in that time, no apprehensions need be excited as to the occurrence of that circumstance. The kettle should be covered, and should hold more liquid than it and, although the season was cold, came up well, is intended to boil, to give room for a brisk ebul-

For HARD-SOAP, mild ley is to be used.— When the soft soap is finished, and the mixture still tolerably hot, add sea salt until the ley drops that the effect of rot must have been inconsidera-clear from the soap : if it closes, add more salt, ble. My other fields were treated in a similar man- and at the same time, slacken the fire; then boil until the froth becomes as light as a reather .which was found tedious. These, likewise, suf- Draw the fire, and pour in salt and water into the The next year, being mixture to cool it, observing to make a rapid absent from home at planting time, I directed the stream, and not to let any drops fall in turning up same process to be followed; but am inclined to the bucket. When the soap is too strong of the think, it was not done with the same attention. I alkali, it will not grain; in that case, add clean fat by degress, until it granulates, stirring it all the time over agentle heat. When it boils, no more fat need be added.

It is to be observed, that if the ashes have been too tightly pressed in the ley tub, the ley will not filtrate; and if they have not been sufficiently pressed, the water will run foul. In the first case, the ashes may be loosened with a long iron scewer; in the latter, they must remain some hours to settle, and also be pressed.

Observation.—The foregoing receipts were some years since given to the Editor, by one of fects of rot might be much diminished, if not alto- the best manufacturers of soap in Philadelphia, gether prevented; but it may not have the desired and he had it tried under his direction, with sucture in a sand heat. This is called the lac spirit, effect in solitary instances, as the insects may cess. He has even recently recovered a large When the tin is dissolved, the following compost transport themselves from fields infected, to those quantity of half made soap, by knowing the proby supplying the deficient ones agreeably to the for some hours. On his return home, the first fresh lime was used than is directed.

REMARKS

On Hydrophobia, more particularly as it occurs in Dogs; in a letter from a gentleman of observation and experience in New-Jersey, dated March 15, 1822.

SIR-I lately read with much pleasure, in the New York Spectator of the 1st instant, Mr. Mid-matter, which the dog threw out of his mouth, and cures of hydrophobia.

As I consider it the duty of every member of may in any way tend to elucidate or corroborate ner, to his great joy, confirmed the truth of it. this wonderful discovery, (the greatest that has yet been made in medical science,) I beg leave to I mentioned to him that I thought the matter of matter of heat) that exists between their intersubmit to your consideration two cases which be depended on.

On the morning of the 18th of December, 1820, while living in Canada, a favorite dog belonging to Dr. M.'s report, that it was the real hydrophobia. me of the Setter breed, showed what I imagined to be symptoms of madness, on which I immediately directed my servant to tie him up in an outhouse, and to give him some salt and water, as he appeared from scratching his neck and throat unin it; this made him in a short time throw up a quantity of yellow frothy matter, and seemed to relieve him very much, so that at 12 o'clock he appeared free from every species of complaint .-Soon after, the servant gave him some water which he lapped freely and immediately threw up a large quantity of the same yellow frothy matter, some of it in large lumps. From these symptoms I was induced to think he had swallow-

ble, his eyes appeared glazed and heavy, his tail drooped, his stomach and bowels were contracted you may think proper or necessary to make to it.

Without expandiation of the contracted of th his back raised in a circular form, and his neck raw from continual scratching. At this time I culty, as he knew and obeyed me as usual: yet soon after, when I held out my stick towards him, he laid hold and left the marks of his teeth in it. In the evening I gave him some more milk and wa-ter and mutton broth, which he took freely and quences or effects of it; but as the custom was cise, and shall chiefly point out by negative pro-

signs of violent madness, that I was under the es have issued from it.

When staying last August, with my friend, Mr. cattle, all of which went mad, yet the Grant, at Montreal, I happened to mention all er felt any bad consequences from it. these circumstances to him, when he, pointing to a favorite dog, lying at his feet, told me, that about two years ago he was in so similar a situation, that he left orders with his servant to shoot him, and as he could not do it himself or be in the way when it was done, he went into the country DR. MITCHELL, M. D.

receipt; after the female farm servant declared question he asked was "have you disposed of the that the mass was worth nothing. Rather less dog?" to which to his great surprise the servant answered "No sir, I could not find in my heart to kill the poor dumb brute, and as he seemed by his violent scratching to have something in his throat or mouth, that caused his illness, I got a opened his mouth for the purpose of examining it ing, and bracing the body, either by plunging, or and his throat, when under his tongue, I observed continuing in it for a certain time. a large Blob or Tumour, which I opened with a penknife, and out of it came a great deal of nasty dleton's letter to you, accompanying Dr. Maroimmediately leapt up, frisked about the room as if matically, we shall consider it according to the
chetti's very interesting report on the symptoms sensible of the cure that had beer effected on division above-mentioned. him, and he is now as well as ever he was." Mr. Grant could hardly believe the story; but the enthe human race, to communicate any thing that trance of the dog into the room in his usual man-

so great consequence, that he ought to draw up a stices, and thus effects a greater approximation of within these eighteen months have fallen within statement, and communicate it to some medical the particles, which were before dilated and remy personal knowledge and information, that may friend, as it might, perhaps, be the means of finding out a cure for the distemper in dogs, which I then thought it was, though was convinced, from species of bath, by its powerful action on the

As I soon after left that country, I do not know whether or not Mr. G. followed my advice; but in case he has not, I now give you all the circumstances of both cases, well convinced that they cannot be placed in better hands; leaving you at til it absolutely bled, to have something sticking liberty to make such use as you may think proper, of this information.

As Dr. M. mentions having the hands properly covered when examining the mouths of patients, I would beg leave to suggest your publishing what mable. material you deem a proper and necessary covering for the hand; with which, and a lancet, at all internal corroborants, consists chiefly in its least one person in each village or large family immediate salutary action on the solids, without symptoms I was induced to think he had swallowed some poisonous substance, on which account I gave him some milk and water and fat mutton broth, which he took freely and appeared as if broth, which he took freely and appeared as if sensible of the attention paid him, and as usual accencessary. And I would also beg leave to suggest the propriety of having this report of Dr. M.'s promulgated throughout the country in general was proposed by the addition of such remarks as leave and consequent indirection.

England, I learnt to worm dogs, which it was proceed: had him and the barrow in which he lay removed said did not prevent their going mad; but in case to a warmer place, which I did without any diffi- they were infected, occasioned a relaxation or which it cannot be resorted to with advantage paralysis in the lower jaw, which disabled them and safety. from biting any thing, and under that idea, I afterwards wormed a number of dogs, but cannot, rections for the use of this heroic remedy. went to rest.

About midnight I was awakened by his incessant and apparently painful barking, which he continued without intermission until day light, when he exhibited what appeared to me such undoubted ease unless carried into the circulation through a brile disposition, which is a cise, and shall chiefly point out by negative propositions, those particular states of the body, in which cold bathing must not be attempted: namely, 1. In a full habit of body, or what is called exhibited what appeared to me such undoubted ease unless carried into the circulation through a brile disposition, at each of place of painful necessity of shooting him. My servant lady a friend of mine, had her face licked all over or ulcers, and every kind of inflammation, whethen told me that the day I desired him to be tied by a favourite greyhound, which had been tied ther external or internal; 3. In obstructions of up, he made a snap at his thigh, and gave it a up on account of being supposed to be infected, the intestines, or habitual costiveness; 4. In afpinch, but having on thick pantaloons and drawers but got loose, and immediately after being again fections of the breast and lungs, such as difficult he did not break the skin, and no bad consequentied up got loose a second time and ran off, and respiration, short and dry coughs, &c. 5. When

ON BATHING.

From Willich's Domestic Encyclopedia, edited by Professor Cooper, and for sale by Abraham Small, Bookseller, Philadelphia.

Bath, in the general acceptation of the term, signifies a convenient receptacle of water adaptfriend to assist me, who held him down while I ed to the various purposes of washing or cleans-

> Baths may be divided into cold, cool, warm, and hot: and these again into natural and artificial. In order to treat this interesting subject syste-

Cold Baths are those of a temperature varying from the 33d to the 56th degree of Fahrenheit's thermometer. The general properties of the cold bath consist in its power of contracting the laxed by heat. That such is the natural influence of cold, cannot be doubted; and hence this whole system, is one of the most important medicinal remedies presented by the hand, and, as it were, supplied by the very bosom of nature.

Even in the most remote times, cold bathing was resorted to, with obvious advantage, by nervous and debilitated persons; but in the dark or middle ages, this genuine source of health was totally neglected, till the good sense of Europeans again adopted it as a general restorative, when the prevailing diseases of relaxation and atony rendered the use of such a remedy inesti-

The superior advantages of cold bathing over

THE FARMER

BALTIMORE, FRIDAY, APRIL 5, 1822.

The comforts, and the profits of rural life, are made up in a great measure, by attention to small matters. Though every one might—how few do, enjoy in their families the sweets collected by the industrious Bee. How little is known by the mass of society, of the natural history or economy of this interesting insect. We shall publish several papers on the management of it, and have begun with a small English treatise of modern date. It is calculated in England that almost every Cottager might keep from four to six hives, and that each one ought to yield him 25 shillings, exclusive of the swarm, so that every one might pay the rent of his cottage from the produce of his hives alone; certainly nothing yields a greater profit, compared with the disbursement than the keeping of bees.

Our files contain other works and communications on the same subject, which will be noticed or inserted as opportunities offer.

IF We have just received from London, a opy of a small work, The American Gardener, from the pen of the celebrated William Cobbett. Our readers will find it very curious and useful, and as soon as we can get the engravings execu ted, we shall commence the publication of the work entire in this paper.

We return our sincere thanks to those of our patrons who have already so promptly and honorably complied with the terms of subscrip-

The long continued and severe illness of Mr. Redding, who attends to the details of this paper, will account for the non-appearance of the Index to the third volume, as well as for other omissions and irregularities. He is again at his desk, to the great relief of the Editor, and the Index may be expected within the next two weeks.

scout to choose the place of their new habitation, by any immediate exterior sign, although the and brush them all into the hive. It will frequently happen that they do. I have known instances in some apia- Thus it may please the reigning monarch of the ries, that the proprietor could always foretel the hive, to expel the infant Queen from her territo- culty of hiving them is encreased. It becomes, swarming of his hives, by observing small clusters of Bees in particular places, and especially on tion and reasoning, or consistently with the rules the chimnies where fires are not much kept. *-This may account for the difficulty which some. I have known her expelled during a shower of should not be considered as a swarm within itself. times occurs, in retaining a swarm in a hive, and rain, on which occasion it was a most heart-renwhich is attributed by the majority of persons, to ding scene, to behold her majesty in all her nasome dislike which the Bees have taken to the tive dignity and beauty, and over whose golden hive, but which in my opinion has its cause in the form no breath of heaven had yet rudely dared giving to every Queen her proportion of subjects choice of a residence, selected by a certain num- to pass, on a sudden exposed to the pelting of the and thereby forming as many distinct hives, ber of Bees, previous to swarming.

The most usual time of swarming is from nine, A. M. to two, P. M. and the weather in gene-

. In an ahiary belonging to a gentleman in Scotland-I was for several years witness to this circumstance, and we were always obliged to cover the chimney with a cloth, to prevent the Bees from entering it. Asmall cluster of Bees was always to be found in the chimney two or three days before the swarming of a particular hive, and one year they actually made good their lodgment in the chimney, from which I took them with a great deal of trouble, but no art nor skill could induce them to remain in the hive-for having selected the chimney, they were determined to have no other residence. This may be one of the effects of a female government, which, whether human

or aniarian, is generally of an absolute nature.

I had once a swarm which shewed such strong symptoms of this wandering disposition, that it flew from the hive four times and four times I hived it afresh.-Having remarked that every time it flew out, its flight increased in distance, I fell upon the expedient of confining the runa-ways during the day time, by letting down both the perforated sliders, and giving them some food, and when it was almost dark, I gave the prisoners about five minutes liberty; I continued this plan for four days, and on the fifth, their truant disposition was completely quelled.

is also certain, that this motion of the wings is a ral clear and bright. The Bees seldom or never marrowbones and cleavers* ;-it has no more efdemonstration of joy—for confine a Bee for a few swarm in high winds, nor when the sky is over-hours, and then restore him to the hive, and he cast—they will, however, often swarm on a sudwill stand for a minute or two waving his wings at den gleam of sunshine, and consequently when it the contrary I am well convinced, that whatever The second criterion of an in- is the least expected by the proprietor. After effect it may have, it is highly injurious, as it creased population, preceding the swarming, is the usual signs of swarming have been exhibited, may prevent the Bees from settling where they the small drops of perspiration which are visible at the entrance, called by the country people, be constantly upon the alert—I have seen so mathematically and the sweating of the hive. This perspiration is my persons lose their swarms, from a supposed have reason to believe that the first congregation have reason to believe that the first congregation is my persons lose their swarms, from a supposed of the Receipt and the sweating of the hive. attended by a particular odour, resembling that conviction upon their minds, that their Bees would of the Bees is merely to assemble the whole of of heated wax, and an increased blackness of the not swarm on that particular day, on account of the community in one body, and then to take stool at the entrance. These may be called the some adverse signs regarding the weather, or, their flight to their selected abode, in some holprognostics of an increasing and superabundant what is still worse, on account of some ridiculow tree or hole in a house or barn. Being, howpopulation; but that which immediately pre-lous superstition or prejudice, like that which is cedes the swarming, and which may indeed be prevalent in the north, that Bees never swarm on providing a suitable dwelling for them, added to called the warning sigh to the proprietor, is the a Saturday, for the very powerful and cogent the instinctive fear of danger which appears to be clustering of the Bees outside of the hive-reason, that the following day is Sunday; that I so strongly impressed upon the Queen Bee, on hanging sometimes in large bodies under the stool, am never disposed to relax in my endeavors to her exposure to the open air, the Bees take to and crowding in such numbers round the en- impress it upon the minds of every apiarian, that their hive and immediately commence their lawhere the working Bees can scarcely gain when Bees have once taken to clustering, not to admission. In the middle of the day the Bees lose sight of them from the hour of nine to two, will also be seen running out of the hive, as if or even later, until the swarm is actually on the rections for the hiving of a swarm, as no two situand the drones will appear the most busy and acwhich prompts the immediate departure of the
tive amongst them. This extraordinary activity swarm, and until that cause can be ascertained under the swarm, and the Rees shakes into something in the inside were driving them out- wing. The cause is actually unknown to us, ations are similar in which it settles. The most will be apparent, and will increase daily, until the moment when the effect will be perceptible when the swarm settles on a post, or an upright the swarm flies off, and when the Bees have must remain indefinite. The departure of a branch of a tree which cannot be cut off, some once taken to clustering and hanging out of the swarm certainly depends upon the Queen, but difficulty then presents itself to the timid and inwhether she be driven from the hive, or quits it experienced Bee-keeper. In all cases a goose's prietor be then strictly upon his guard-for the voluntarily, is inveloped in great doubt. The wing will be found of essential service, as the prietor be then strictly upon his guard—for the voluntarily, is inveloped in great doubt. The following day perhaps, will give him the wished for addition to his stock.

It has been the subject of dispute with many eminent Bee-masters, whether the Bees, a few days previous to the swarming, do not send out a moment of her expulsion cannot be determined by the consequence. In this view of the case, the days previous to the swarming, do not send out a low moment of her expulsion cannot be determined by the case, he may proceed boldly with his work, ry at a time, when, according to human calcula- however, in this stage, a matter of doubt, of politeness, her abode ought to be tolerated; pitiless storm; but her majesty managed it well, for she settled on the gooseberry bush most proximate to the parent hive, and she was soon surrounded by her subjects, that not a drop of rain could reach her

AGRIC. MEDICUS.

The Hasty Pudding,

A Poem in three Cantos, by JOEL BARLOW, written at Chambery, in Savoy, January 1793. Omne tulit punctum qui miscuit utile dulci.

He makes a good breakfast who mixes pudding with molasses.

CANTO I.

Ye Alps audacious, thro' the Heavens that rise, To cramp the day and hide me from the skies; Ye Gallic flags, that o'er their heights unfurl'd, Bear death to kings, and freedom to the world, I sing not you. A softer theme I chuse, A virgin theme, unconscious of the Muse, But fruitful, rich, well suited to inspire The purest frenzy of poetic fire.

Despise it not, ye Bards to terror steel'd, Who hurl'd your thunders round the epic field; Nor ye who strain your midnight throats to sing Joys that the vineyard and the still-house bring;

The first question would then be-ls it, under all Or on some distant fair your notes employ, question should be decided in the affirmative, the My morning incense, and my evening meal, next question would be—how?—to what extent? The sweets of Hasty-Pudding. Come, dear bowl The governor of the state, for the time being, Glide o'er my palate, and inspire my soul, The milk beside thee, smoking from the kine,

> Oh! could the smooth, the emblematic song And, as they roll in substance, roll in rhyme, But rising grateful to the accustom'd ear, All Bards should catch it, and all realms revere

Assist me first with pious toil to trace Thro' wrecks of time thy lineage and thy race; Declare what lovely squaw, in days of yore, (Ere great Columbus sought thy native shore) First gave thee to the world; her works of fame I send you a poem on "Hasty Pudding, by Joe! Have liv'd indeed, but liv'd without a name. Barlow," which I think merits insertion in the Some tawny Ceres, reddiess of her days

Far as his rays extend, as long as they endure. Dear Hasty-Pudding, what unpromis'd joy

roam.

hoard

Cold from his cave usurps the morning board. London is lost in smoke and steep'd in tea; No Yankee there can lisp the name of thee; The uncouth word, a libel on the town, Would call a proclamation from the crown.* For climes oblique, that fear the sun's full rays, Chill'd in their fogs, exclude the generous maize; A grain whose rich luxuriant growth requires Short gentle showers, and bright etherial fires.

But here tho' distant from our native shore, With mutual glee we meet and laugh once more The same! I know thee by that yellow face, That strong complexion of true Indian race, Which time can never change, nor soil impair, Nor Alphine snows, nor Turkey's morbid air; For endless years, thro' every mild domain, Where grows the maize, there thou art sure to reign.

* A certain king, at the time when this was written, was publishing proclamations to prevent A-merican principles from being propagated in his country.

But man, more fickle, the bold license claims, In different realms to give thee different names. Thee the soft nations round the warm Levant Palanta call, the French of course Polante; E'en in thy native regions, how I blush To hear the Pennsylvanians call thee Mush! On Hudson's banks, while men of Belgic spawn Insult and eat thee by the name supparon. All spurious appellations void of truth: I've better known thee from my earliest youth, Thy name is Hasty-Pudding! thus our sires Were wont to greet thee fuming from their fires; And while they argu'd in thy just defence With logic clear they thus explained the sense; " In haste the boiling cauldron o'er the blaze, "Receives and cooks the ready powder'd maize; "In haste'tis serv'd, and then in equal haste,
"With cooling milk, we make the sweet repast. " No carving to be done, no knife to grate "The tender ear, and wound the stony plate; "But the smooth spoon, just fitted to the lip, And taught with art the yielding mass to dip, "By frequent journies to the bowl well stor'd, "Performs the hasty honors of the board." Such is thy name, significant and clear, A name, a sound to every Yankee dear, But most to me, whose heart and palate chaste Preserve my pure hereditary taste.

There are who strive to stamp with disrepute The luscious food, because it feeds the brute; In tropes of high-strain'd wit, while gaudy prigs Compare thy nursling man to pamper'd pigs; With sovereign scorn I treat the vulgar jest, Nor fear to share thy bounties with the beast. What though the generous cow gives me to quaff The milk nutritious; am I then a calf? Or can the genius of the noisy swinc, Tho' nurs'd on pudding, thence lay claim to mine? Sure the sweet song I fashion to thy praise, Runs more melodious than the notes they raise.

My song resounding in its grateful glee, No merit claims; I praise myself in thee My father lov'd thee through his length of days : For thee his fields were shaded o'er with maize: From thee what health, what vigour he possest, Ten sturdy freemen sprung from him attest; Thy constellation rul'd my natal morn, And all my bones were made of Indian corn. Delicious grain! whatever form it take, To roast or boil, to smother or to bake, In every dish 'tis welcome still to me, But most, my Hasty-Pudding, most in thee.

Let the green Succatash with thee contend, Let beans and corn their sweetest juices blend, Let butter drench them in its yellow tide, And a long slice of bacon grace their side; Not all the plate, now fam'd soe'er it be, Can please my palate like a bowl of thee.

Some talk of Hoe-cake, fair Virginia's pride, Rich Johnny-cake this mouth has often tri'd; Both please me well, their virtues much the same : Alike their fabric, as allied their fame, Except in dear New-England, where the last Receives a dash of pumpkin in the paste, To give it sweetness and improve the taste. But place them all before me, smoking hot, The big round dumpling rolling from the pot; The pudding of the bag, whose quivering breast, With suct lin'd leads on the Yankey feast; The Charlotte brown, within whose crusty sides A body soft the pulpy apple hides; The yellow bread, whose face like amber glows, And all of Indian that the bake-pan knows— You tempt me not-my fav'rite greets my eyes, To that lov'd bowl my spoon by instinct flies.

CANTO II.

To mix the food by vicious rules of art, To kill the stomach and to sink the heart, To make mankind, to social virtue sour, Cram o'er each dish, and be what they devour ; For this the kitchen Muse first framed her book, Commanding sweats to stream from every cook; Children no more their antic gambols tried, And friends to physic wondered why they died. Not so the Yankey-his abundant feast, With simples furnished, and with plainness drest, A numerous offspring gathers round the board, And cheers alike the servant and the lord; Whose well-bought hunger prompts the joyous taste.

And health attends them from the short repast. While the full pail rewards the milk-maid's

The mother sees the morning cauldron boil; To stir the pudding next demands their care, To spread the table and the bowls prepare; To feed the children as their portions cool, And comb their heads, and send them off to school.

Yet may the simplest dish, some rules impart, For nature scorns not all the aids of art. E'en Hasty-Pudding, purest of all food, May still be bad, indifferent or good, As sage experience the short process guides, Or want of skill, or want of care presides. Whoe'er would form it on the surest plan, To rear the child and long sustain the man; To shield the morals while it mends the size, And all the powers of every food supplies, Attend the lessons that the Muse shall bring, Suspend your spoons, and listen while I sing.

But since, O man! thy life and health demand Not food alone, but labour from thy hand, First in the field, beneath the sun's strong rays, Ask of thy mother earth the needful maize; She loves the race that court her yielding soil, And gives her bounties to the sons of toil.

When now the ox, obedient to thy call, Repays the loan that fill'd the winter stall, Pursue his traces o'er the furrow'd plain, And plant in measur'd hills the golden grain. But when the tender germe begins to shoot, And the green spire declares the sprouting root, Then guard your nurshing from each greedy foe, Th' insidious worm, the all-devouring crow. A little ashes, sprinkled round the spire, Soon steep'd in rain, will bid the worm retire; The feather'd robber with his hungry maw Swift flies the field before the man of straw, A frightful image, such as school boys bring When met to burn the Pope or hang the King.

Thrice in the season through each verdant row Wield the strong plough-share and the faithful

The faithful hoe, a double task that takes, To till the summer corn, and roast the winter cakes.

Slow springs the blade, while check'd by chilling rains,

Ere yet the sun the seat of Cancer gains: But when his fiercest fires emblaze the land, Then start the juices, then the roots expand; Then, like a column of Corinthian mould, The stalk struts upward, and the leaves unfold: The bushy branches all the ridges fill, Entwine their arms, and kiss from hill to hill. Here cease to vex them, all your cares are done Leave the last labors to the parent sun; Beneath his genial smiles the well-drest field, When Autumn calls a plenteous crop shall yield.

Now the strong foliage bears the standards high, And shoots the tall top-gallants to the sky; The suckling ear their silky fringes bend, And pregnant grown, their swelling coats distend : The loaded stalk while still the burthen grows, O'erhangs the space that runs between the rows High as a hop-field waves the silent grove, A safe retreat for little thefts of love, When the pledg'd roasting ear invite the maid,

His generous hand unloads the cumbrous hill, And the green spoils her ready basket fill; Small compensation for the two-fold bliss,

The promis'd wedding and the present kiss.
Slight depredations these; but now the moon Calls from his hollow tree the sly raccoon; And while by night he bears the prize away, The bolder squirrel labours through the day. Both thieves alike but provident of time, A virtue, rare, that almost hides their crime. Then let them steal the little stores they can, And fill their gran'ries from the toils of man; We've one advantage where they take no part,— With all their wiles they ne'er have found the art To boil the Hasty-Pudding; here we shine Superior far to tenants of the pine This envied boon to man shall still belong, Unshar'd by them in substance or in song.

At last the closing season browns the plain, And ripe October gathers in the grain; Deep loaded carts the spacious corn house fill, The sack distended marches to the mill; The lab'ring mill beneath the burthen groans, And show'rs the future pudding from the stones Till the glad house wife greets the powder'd gold, And the new crop exterminates the old.

CANTO III.

THE days grow short; but tho'the falling sun To the glad swain proclaims his day's work done, In ample draughts the thin diluted soup, Night's pleasing shades his various task prolong, And yeild new subjects to my various song. For now, the corn house fill'd, the harvest home, Th' invited neighbours to the Husking come; A frolic scene, where work, and mirth, and play, Unite their charms, to chase the hours away.

Where the huge heap lies center'd in the hall, The lamps suspended from the cheerful wall, Brown corn fed nymphs and strong hard-handed

beaux,

Alternate rang'd, extend in circling rows, Assume their seats, the solid mass attack; The dry husks rustle and the corn cobs crack; The song, the laugh, alternate notes resound, And the sweet cider trips in silence round.

The laws of Husking every wight can tell; And sure no laws he ever keeps so well: For each red ear a general kiss he gains, With each smut ear she smuts the luckless swains But when to some sweet maid a prize is cast, Red as her lips, and taper as her waist, She walks the round, and culls one favored beau Who leaps the luscious, tribute to bestow. Various the sports, as are the wits and brains Of well pleased lasses and contending swains: Till the vast mound of corn is swept away, And he that gets the last ear wins the day.

Meanwhile the house-wife urges all her care, The well earn'd feast to hasten and prepare. The sifted meal already waits her hand, The milk is strain'd, the bowls in order stand, The fire flames high; and, as a pool (that takes The headlong stream that o'er the mill dam JOHN S. SKINNER, Eso. breaks)

Foams, roars and rages with incessant toils, So the vext cauldron rages, roars and boils.

Then strews the flour and thickens all the flood. Long o'er the simmering fire she lets it stand : To stir it well demands a stronger hand; The ladle flies; at last the toil is crown'd; When to the board the thronging huskers pour, And take their seats as at the corn before.

I leave them to their feast. There still belong More copious matters to my faithful song. For rules they are, tho'ne'er unfolded yet, Nice rules and wise how pudding should be ate. Some with molasses line the luscious treat.

And mix like Bards, the useful with the sweet. A wholesome dish, and well deserving praise, To meet her swain beneath the new-form'd shade; A great resource in those bleak wintry days,

When the chill'd earth lies buried deep in snow, And raging boreas drives the shivering cow.

Blest cow! thy praise shall still my notes employ, Great source of health, the only source of joy; How oft thy teats these pious hands have prest! How oft thy bounties prove my only feast! How oft I've fed thee with my fav'rite grain! And roar'd, like thee, to find thy chrildren slain!

Ye swains who know her various worth to prize, Ah! house her well from Winter's angry skies. Potatoes, Pumpkins, should her sadness cheer, Corn from your crib, and mashes from your beer; When Spring returns she'll well acquit the loan, And nurse at once your infants and her own.

Milk then with pudding I should always chuse; To this in future I confine my Muse, Till she in haste some farther hints unfold, Well for the young, nor useles to the old. First in your bowl the milk abundant take, Then drop with care along the silver lake Your flakes of pudding; these at first will hide But when their growing mass no more can sink, When the soft island looms above the brink, Then check your hand : you've got the portion's

So taught our sires, and what they taught is true. There is a choice in spoons. Tho' small appear The nice distinction, yet to me 'tis clear, The deep bowl'd Gallic spoon, contriv'd to scoop Performs not well in those substantial things, Whose mass adhesive to the metal clings Where the strong labial muscle must embrace, The gentle curve, and sweep the hollow space, With ease to enter and discharge the freight, A bowl less concave but still more dilate, Becomes the pudding best. The shape, the size, A secret rests unknown to vulgar eyes. Experienc'd feeders can alone impart A rule so much above the lore of art. These tuneful lips, that thousand lips have tried, With just precision could the point decide, Tho' not in song; the muse but poorly shines In cones and cubes and geometric lines. Yet the true form, as near as she can tell, Is that small section of a goose-egg-shell, Which into equal portions shall divide The distance from the centre to the side.

Fear not to slaver; 'tis no deadly sin, Like the free Frenchman, from your joyous chin Suspend the ready napkin; or, like me, Poise with one hand your bowl upon your knee; Just in the zenith your wise head project, Your full spoon, rising in a line direct, Bold as a bucket, heeds no drops that fall, The wide mouth'd bowl will surely catch them all.

200 JOSEPH DELAPLANE'S NEW PLOUGH.

Montgomery County, 25th Feb. 1822.

Sir,-Through the politeness of my valuable friend, Mr. Reese, I am in possession of every No. of the American Farmer, up to 43 of the 3d vol. First with clean salt she seasons well the food, all of which have been regularly received, consequently attentively perused. I therefore tender you my thanks simply, but very sincerely, for the great advantage I have received from them; at The husband takes his turn; and round and round the same time regret extremely, that it is not in my power to contribute something for the advantage or amusement of those, from whom I have had so much-I however, beg leave to give you a description of a plough, which I invented last fall, for the purpose of aiding in the breaking up of my corn and tobacco lands. I had barely time to put it in operation before the frosts set in-the trial, however, was sufficient to ascertain that it will perform the work it is intended to do-my calculations are, to follow the barshare plough with it, in every fur-

My substratum plough, as I name it, (the three the public much benefitted. coulters of which runs in a space of nine inches) merely pulverises the ground, and leaves it where it finds it-the above depth of thirteen (or even fifteen) inches, I can plough on any lands clear of stumps, stone, &c. I work three horses in the barshare and two (strong ones) in the substratum plough; in the latter both horses walk in the furrow, one before the other-the plough is simple and not expensive in its construction, being composed of a beam, nearly the size and length of fixed similar to those on shovel ploughs; and near of timber, one on each side, nearly the size of the crowd each other: (several gentlemen who have the centre coulter in front, which would render hope will be a valuable plant.

the plough less liable to choke, and I doubt not but it would be better). not but it would be better)-each coulter is strongly braced to, and tightly wedged in, their respective timbers-near the centre of the beam, and directly in front of the coulters, is fixed a common plough wheel, by which we regulate the depth the plough is to run. I inclose you, indeed, a rough diagram of my plough, but have no doubt but your ingenuity will readily perceive the plan on which it is made. I had intended delaying any communication on this subject, until I had tested the advantages of my plough, but have now a desire that some abler farmer than myself will make experiments with it-the advantages which I expect to derive from the use of this plough, is that of having the ground pulverized deep, to re-tain moisture and admit the roots of plants, and still to have the soil near the surface. If you think this communication worth a place in your invaluable journal, you will oblige me by giving it a place there, provided you will dress it up in such a garb as to render it fit for the public eye-as to yourself, I am certain you will not ridicule my blunders, when I inform you that this was written in the evening after a laborious day's work, at trimming of apple trees. I fear you are now beginning to flatter yourself that you will presently come to the name of some conspicuous farmer of Montgomery. Not so-I am nothing but an o-verseer or manager. I have, however, the good fortune to be employed by a very indulgent, kind and worthy gentleman, W. Bowie, Esq. of Georgetown-he is much pleased with my plough, and would readily give you his opinion of it, if required of him. I am sir, with much respect and esteem, your obedient servant,

d,

row, the former to cut and turn six, the latter to altered word or figure, and our readers will agree, cut and pulverize seven inches deep, which will that if Mr. D.'s plough of three coulters will do "
give me thirteen inches in depth, of loose mould, its work only as well as his pen has done, friend to receive and hold the most abundant rains.—
Brigg's object will have been fully answered, and "

Editor's Correspondence.

Extract of a letter from the Right Honorab le Sir John Sinclair.

I have the pleasure to tell you, that the Virginian Thorn, is likely to prove a very great acquisition to this country, at least if it will stand the severity of this climate. In one year's time it has grown from the seed you sent me, eighteen the beam of the barshare plough, with handles inches high:-and the season being open, it is still, (on the 31st Jan. 1822,) in full verdure. The the hind end of the beam, are framed two pieces nursery man to whom I entrusted the charge of ceives a coulter directly opposite to each other; pounds sterling, if it can be procured of good "purchase." it, (Mr. Lawson, Bland Street, Edinburgh,) another coulter is inserted in the beam, about four quality, sent in a ship coming to Greenock. I inches behind the two first, so that they may not have received from Mr. Charles E. Rowand, of

> The following extract is from the pen of a Farmer of the first respectability in England, to the Editor; whose object in publishing it is, to collect for the writer of the letter such information as will enable him on his arrival, to make a suitable selection of land, with the least loss of time. The views of the writer himself are sufficiently explained in his letter. He is known throughout England as a gentleman of high char-acter, and the owner and breeder of the most improved stock in the Kingdom. The Editor of ter which accompanied these articles, as it conthe Farmer, will esteem it a favor to be furnished with a line from any gentleman who may happen to see this, and may know of any place for sale, which they may suppose would be well adapted to the objects of his friend in England.— From such men, coming with such objects, our country cannot fail to derive lasting advantages.

Syren, from this port for Baltimore; that vessel sailed several weeks ago, but it is by no means improbable that you may receive this letter before she shall reach the U. S. as well on the general and public spirited endeavours to improve the state of our agriculture; indeed I have derived great satisfaction in doing so.

I sent to you, by the Syren, a small quantity of Swedish black oats and turnip seed; part of rest for distribution among some of our common his exit in a more becoming manner. - Editor. friends. You will pardon my taxing you with this trouble. My present purpose in writing to you, is to state some circumstances, and to ask your advice and your aid on the same subject .-During an excursion to the mines some 18 months ago, I visited several of the principal iron establishments, which as you may imagine, are con-nected with extensive farms and cultivated tracts (in the hands of rich proprietors,) for the maintenance of the numerous labourers, employed in the different operations, connected with the staple fabric of Sweden. One or two of those pro-prietors, who are very eminent and very worthy men, in consequence of a conversation I had with them, on the subject, said that they would cultivate the ruta baga, in the most careful manner possible, and in a more extensive manner than they had done, on purpose to procure the best possible seed, for my agricultural friends at home; the year has gone round, and though the seed was ready at the sailing of the Syren, unfortugenuine and soundest Swedish turnip seed, that has over been raised; indeed, it is impossible to have and Count Schwiern. These gentlemen are known to Mr. Keyser, (or the two first of them are,) who pletely succeeded.

Yours, &c. CHRISTOPHER HUGHES, JR.

IMPROVEMENT IN THE CULTURE OF POTATOES.

A correspondent has requested us to insert the following :- " The first year, (he says) I cut the potatoes in three pieces, the top, the middle and the bottom parts, (I suppose every person knows the top of the potato from the bottom, as the principal eyes are on the top) and planted these in turnpike. The season to commence on fifteenth three rows. The top plant was ten days earlier of April, and end on the fifteenth of July. Terms than the middle plant, and a much greater crop; the middle plant was earlier that the bottom, groom, which must accompany the Mare, for if o-and a better crop; the bottom produced but a mitted, the horse will in no case be brought out of and a better crop; the bottom produced but a very indifferent crop. For some seasons past the stable, so it will be useless trouble to send I have only planted the top eyes, and I may the Mare—50 cents a week pasturage, which safely say, I have the best crop, and driest potatoes in the country. None need be deterred from this plan on the ground of waste; for after the top is cut off, the remainder keeps better and accountability for accidents of any kind.

longer for use than if the potato was preserved EXILE is a beautiful dark bay sixteen hands entire. As proof of this, lay a whole potato on high, will be three years old in May He is adthe top of the ground, or in any exposed place, mitted by the best judges who have examined him and it will shew, that the top plants grow faster, to be the finest description of horse ever important are many inches long, before there is any growth from the bottom."

DISEASES OF SWINE.

EXILE.

The imported "Cleveland Bay," will be let to Mares the approaching season, at Carroll's Manor, 15 miles from Baltimore on the Frederick town of April, and end on the fifteenth of July. Terms TWENAY DOLLARS, and one dollar for the must be paid before the Mare is removed. An experienced groom has charge of the horse, and every attention will be given to Mares, but no

sire of Exile is considered one of the most splendid coach horses in England; his grandsire is the famous Yorkshire horse Mollineaux, sold for sually bad weather she must have experienced on the coast of Norway. You will perceive, that I have not omitted to follow you as far as my interfect opportunities enable me, in your laudable cure this disease.

In this time the season of the year, as of the unusually bad weather she must have experienced not discover any signs of inflamation, when I open-old English hunter; and it is the cross from them that makes the Jersey horse more valuable than correspondents may teach me how to prevent or the Southern, giving them bone, size, and high round action. The colour of these horses is confined to the various shades of bay, always with mealy noses, and they combine the fine symmetry, smoothness of coat and clean legs of the blooded. In fine it is now admittd in Europe that this breed without taking from their activity, wind and fi-

BARNEY DEAN, Manager. TEXILE will remain 15 days at Crowl's stables, in the city of Baltimore.

Tuckahoe and Young Tom.

The very celebrated race horse TUCKAHOE, bred by John Wickham, Esq. of Richmond, will stand the ensuing season at Wooten's tavern on the York road and at the Maryland tavern, on the Frederick road-each four miles from Baltimore. He will go to the Maryland tavern on WEDNESDAY Morning, and there remain until SATURDAY night—the remainder of the week he will be at Wooten's.

YOUNG TOM.

Bred by Cornelius Howard, esq. and got by Judge Winchester's Old Tom, will stand during the same period, changing places with Tuckahoe; so that while one is at Wooten's the other will be at the Maryland tavern, and so vice versa.

That those disposed to patronise the best breed of Horses may this year have no excuse, on the score of terms, Tuckahoe will be let to Mares at the very reduced rate of \$10 each, and Young Tom at \$5-to be sent in all cases with the Mares; if not paid before the first of July, double those sums respectively will be rigorously exacted.

Tuckahoe has been sent into this neighborhood at the instance of Gen. Charles Ridgely, of Hampton, who once owned him, and who pronounces him in his blood and his foals, equal to any horse in the Union.

Good pasturage will be provided for Mares from a distance, but no responsibility for accidents or escapes.

Agents for the owners: At Wooten's, JOHN WOOTEN. At the Maryland Tavern, RICHARD STONE.

PEDIGREE.

TUCKAHOE, was got by Florizel, who was never beaten, and was got by sorrel Diomede an im-ported son of the celebrated Eclipse, out of a full bred mare. Tuckahoe's dam was got by the imported horse Alderman, who was got by Pot-8-o's, one of the best sons of Eclipse, out of Lady Bolingbroke who was got by Squirrel out of Cy-pron, the dam of King Herod, her dam by Clockfast, an imported horse of high character, grand dam by Col. Symmes' Wildair, a noted horse of the best blood in this country, out of a thorough bred

Fourth, when ants, earwigs, or or table cloth may be spread; then holding the gin swarm to be attended with any benefit to the other vermin, are observed to enter the hive hive containing the second swarm over it, give a proprietor, and it is certainly a manifest injury to without experiencing any opposition from the few sharp knocks at the top, and the Bees will the hive which has produced it. In the common Bees. Fifth, when the Bees desist from taking their fall immediately on the cloth; proceed then, ei-hive there is no method of obviating it; but in periodical flights. Sixth, when on turning up the ther with your finger or a stick, to guide a few of the Huish Hive, I would recommend immediate-hive, the Bees shew no symptoms of anger; but the Bees to the entrance of the parent hive, and ly the extraction of the side combs; and should rather croud to the top of the hive. Seventh, they instantly testify their joy by a humming noise, and crowd into the hive. This is is the best period to catch the Queen Bee; and to those who will then be found in which they can work, the given them. These cases all require a particular the judgment and skill of the apiarian.

The drones are very often killed in this month, and a particular value should always be put upon those hives which kill their drones the earliest .-I have invariably found that the produce of those hives is much greater than those which kill their drones late in the season.

AUGUST.

In many counties of England, and particularly the western, the keepers of Bees begin in this month to suffocate their Bees, from an ill-founded supposition, that the honey season is over, and that the Bees are thenceforth living upon their store. It is, however, a plan not only injudicious, but highly injurious to the proprietor; for it must be obvious to every one that the month of August is particularly remarkable for the bloom of certain plants and flowers, from which the Bee collects a vast store of honey. I have only to no-tice the mignionette, one of the richest flowers which blows in regard to honey, and the heath, which continues in bloom until the month of October. This month is also noted for being more sultry than any other of the year, and consequently a greater secretion of the mellifluous the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be the apiarian should be this month directed:—the limit be a should be a shou honey-dews* with which this month, in a fine season, particularly abounds; and few people are wasps. In the first case, a removal of the atseason, particularly abounds; and few people are ignorant of the increase of weight which will be perceptible in a hive, after a few days on which the honey-dew has abounded. It is, in fact, the manna from heaven for the Bees, and I would not suffocate a single hive, until every hope had vanished of a honey-dew. It also happens in this month that the Bees begin to kill their drones, which is the immediate signal for the ignorant Bee-master to purchase a bundle of matches, wherewith to suffocate his Bees;—this is per-formed on the erroneous supposition that the massacre of the drones indicates the close of the attached to the Huish Hive is well adapted for honey season; but it is impossible to entertain a more erroneous idea, it having, in fact, no affini- larged at pleasure, with celerity and cleanliness. ty with the honey season. It is, in the first place and I believe I can be borne out in my assertion, Remarks on the means of preserving inhabited a certain indication of a prosperous hive; and, in the skilful proprietor himself, that the hives the second, it is a proof that the progress of fe-of Captain Call, of Taplow Hill, during one of cundation has ceased in the hive for the season : the most violent attacks which I ever beheld, up-I would not, therefore, advise any person to take that particular event as the signal for the suffocation of his Bees; for in some hives it takes place very early, and the proprietor, by this premature step, loses a great portion of that honey which the Bees would deposit in the cells, in which the Bees were bred. So far from attempt- adroitness watch its opportunity to enter the hive, which the Bees were bred. So far from attempting to suffocate my Bees, were I ever guilty of such a barbarous practice, I would not hesitate to gligence or carelessness of the proprietor an take from my hives a portion of the honey, with take from my hives a portion of the honey, with opening has been left behind. I have good the well-founded hope of the vacuum being replenished before the close of the season. There erished by the robberies of the wasps than is geis no other just criterion for the suffocation of the nerally conceived, and the most certain way of hives in this country, than the total decay of all diminishing the number of these arch-enemies of the wild and cultivated flowers and shrubs; and the Bees, is to hunt out their nests, and either until that has taken place, no suffocation of the blow them up with gunpowder or suffocate the

system of management, and much must be left to hives should take place.* Though a decided horde of thieves by a handful of brimstone.* enemy to the system of suffocation, I have been The cottager, in general, entertains an opinion thus explicit upon it; for as long as it prevails amongst the cottagers it is as well that the best no means the case, for the wasp will pay no atmethod should be adopted, by which the greatest cention whatever to the Bees, if he can but sucprofit can be obtained.

This month is the best in the year for the prowhich it will be prudent to preserve through the continual annoyance which the hive consequentwinter; and let him keep a strict watch upon the ly undergoes, added to the robbery of the honey, weaker hives, as the pillaging system is about to obliges the Bees to vacate the hive, leaving the commence.

in our gardens; and it is incredible the number of guard his hives against the attack of the wasp-Bees which are annually destroyed by this artful it is not of that trifling consequence which many insect. Let it be the constant study of every individual, who values the life of a Bee, to destroy the ruin of many wholesome hives, which the every spider which he meets with in his garden; imprudence or negligence of the proprietor has nor can this advice be too often repeated to the left exposed to the depradatory attack. cottagers, who, having, generally speaking, no idea of keeping their apiaries clean, suffer the against the wasp and other insects, and the prospiders to spin their webs on the very stools, on prietor having convinced himself that his hives which their hives are placed. What follows (as far as Sec. 13) is common to also applied, with the utmost success to a wooden steps; but no sand is laid upon the plaster-work

II. Sec. 14. The method of extra-lathing may be applied, to ceiling joists, to slooping roofs, and laths ought to be nailed very close to each other. When either of the ends of any of the laths laps

covered with a pretty thick coat of the same rough plaster spoken of above, (Sec. 9.)-A second layer of laths ought then to be nailed on; each lath being, as it is put on, well spunged and bedded sound into the soft rough plaster. (For this reason no more of this first coat of rough plaster ought to be laid on at a time than what can be immediately followed with the second layer of

The laths of this second layer ought to be as close to each other as they can be, to allow of a

proper clench of the rough plaster.

The laths of this second (b) layer may then rough plaster; or it may be plastered over in the

III. Sec. 16. The third method, which is that of inter-securing is very similar, in most respects. Sec. 6. The method of double under-flooring is, all, if the chopped hay and the quick lime be pro-wards to be laid upon it. Inter-securing is applicable to the same parts of a building as the method of extra-lathing just described; but it is not often necessary to be made use of.

Sec. 17. I have made a prodigious number of exheriments upon every part of these different methods. I caused a wooden building to be constructed at Chevening, in Kent, in order to perform them in the most natural manner.-The methods of ex-

clined, or sometimes horizontal. † N. B. Through the whole of this memoir only one kind of plaster or mortar is mentioned, unless when otherwise expressed.

As there is plaster enough provided for the nurposes in question, more is not only useless, and conveniences.

be required.

ONLY ones made use of in that building.

On the 26th of September of last year (1777) had the honor to repeat some of my experiments is very long a detailed account of many other exbefore the President and some of the Fellows of the Royal Society, the Lord Mayor and Aldermen of London, the Committee of City Lands, 'several of the foreign ministers, and a great num-

ber of other persons.

Sec. 18. The first experiment was to fill the lower room of the building (which room was about 26 feet long, by 16 wide) full of shavings and faggots, mixed with combustibles; and to set them all on fire. The heat was so intense that the glass of the windows was melted like so much common sealing wax, and ran down in drops; yet the flooring boards of that very room were not burnt through; nor was one of the side timbers, floor-joists, or ceiling joists, damaged in the smallest degree; and the persons who went into the room immediately over the room filled with fire, did not perceive any ill effects from it whatever; (even the floor of that room being perfectly cool

underneath.)

Sec. 19. I then caused a kind of wooden building (of full 50 feet in length and of three stories high It is certainly no diminution of the force of this and to run hazards. 3d. Speculators will build in the middle) to be erected, quite close to one evidence that the experiments recorded are in whatever will seil, or let, and put them to least covered this building, with above eleven hundred kiln fagots, and several loads of dry shavings; flame was no less than 87 feet perpendicular, from the ground; and the grass upon a bank, at 150 tion on this subject; by proving this, we shall feet from the fire, was all scorched, yet the secured wooden building, quite contiguous to this vast heap of fire was not at all damaged, except some Earl of Chatham then, who was the father-in-law parts of the outer coat of plaster work. This extown on fire; and to shew how effectually even a to his then youthful son, the memorable Mr. Pitt, again. wooden building, if secured according to my new method, would stop the progress of the flames on to exhibit another incendium [or conflagration] that side, without any assistance from fire-engines, &c

Sec. 20. The last experiment I made that day, was the attempting to burn a wooden stair-case, secured according to my simple method of underflooring. The under side of the stair-case was extra lathed .- Several very large kiln fagots were laid and kindled, under the stairs and upon the steps: This wooden stair case notwithstanding resisted (as if it had been of stone) all the attempts that were made to consume it. I have since made five other still stronger fires upon this same staircase, without having repaired it; having moreover filled the small space in which this stair-case, is, entirely with shavings and large fagots: but the stair case is however still standing and is but lit-

tle damaged.

secure the floors; and that according to the method of single under-flooring described above (in Sec. 2, 3, 4, and 5.)—The extra expense of it (all materials included) is only about nine pence per square yard: unless there should be particular difficulties attending the execution, (in which case it will vary a little.)-When quick lime is made use of, the expense is a trifle more.

The extra-expense of the method of extra-lathing is no more than six pence per square yard for the timber, side walls and partitions; but for the ceilings about nine pence per square yard .-

† It will be seen hereafter, that there was plassering upon more or less of this building on its outer side.

tra-lathing and double under-flooring were the (No extra lathing is necessary for the generality of experiments; of which each consequently conof houses.)

Sec. 22. I purpose giving to the world before it parts of each of the methods above described; and relative to their joint or separate application to different kinds of buildings, and to the different constituent parts of a house ;)-to which I shall add a full explanation of the principles upon which they are founded, and the reasons for their certain and surprising success.-In the mean time I have taken the liberty of troubling the Society with this short account.*

The paper of Lord Stanhope finishing here, it now belongs to us to authenticate his state-

The internal evidence in their favor chiefly rests on the fact, that his account stands printed in the Transactions of the Royal Society of London, pursuant to a vote of its President and during that enormous conflagration immediately Council; and that none of the numerous persons referred to as his witnesses, have chosen to contradict his statements during a long course of years.

which will soon be demonstrated:

that Lord Stanhope made his first public exhibi-"On Friday, Lord Mahon's indefatigable spirit is to Lord Mayor, foreign ministers, and all lovers of philosophy and the good of society; and means to illuminate the horizon with a little bonfire of 1200 fagots, and a double edifice. Had our dear friend [namely the author] been born sooner, Nero and the second Charles could never have amused themselves by reducing to ashes the two noblest cities in the world †."-2d. The plan of Lord Stanhope was not without other independent support; for it had succeeded, by the use of iron plates in-stead of plaster, in the hands of Mr. David Hartley, (who signed the treaty between the U. S. and Great Britain in 1782.) This gentleman made a display of a double experiment on this subject in 1774, at Lord Despenser's in West Wycombe; where the fire from two cart loads of dry fagots placed in a room 15 feet by 14, could Sec. 21. In most houses it is necessary only to not penetrate upwards through the ceiling; nor could the fire from several fagots resting on the floor above, descend into the room below, though then vehemently heated; the boards of the floor above being merely a little blackened by the trial. A second operation on a much larger scale took place before the King of England and a large concourse of spectators, on one of the commons near London, with an effect equally happy. Lord varies from light blood-red to dark mahogany; Stanhope and Mr. Hartley therefore may be considered as having performed corresponding sets

* N. B. It is not known that this promise was ever fulfilled by the author.

firms the other.—3d. The Austrian Ambassador at London, struck with these remarkable results, communicated the particulars to the Flemish heriments I have made upon this subject, and of the various advantages arising from my method; Emperor of Germany; when the well known (with several particulars relative to the different Abbe Mann was quickly sent to England to examine into the particulars. He spoke favorably of both plans, and especially (it is believed) of Lord Stanhope's; and their Royal and Imperial Academy of Sciences and Belles Lettres, in order to extend the knowledge of the facts, printed the Abbe's report separately from their Transactions, with a supplement by the Abbe, in which were included some fresh experiments in confir-mation, by Col. Brequin. This then, in various ways, corroborates what was done in England.‡

To this amount of evidence there is nothing to oppose, but the fact, that the principles in question have not been adopted in general practice. But this is merely negative proof, and easily set aside.-1st. Few house-holders in old countries live in tenements built by themselves. 2d. If they did, many have neither money, nor strength of mind to act upon their own opinions; and many are too willing to confide to their good luck, end of the secured wooden house. NOTICES OF THE

NORTH DEVON CATTLE.

Mr. BINGLEY, in his Memoirs of British Quadrupeds, gives the following account of this Breed of Cattle.

By all judges of Cattle, the Devonshire Breed is confessed to be one of the most beautiful, and at the same time one of the most valuable, which our Islands produce. They are of a large size, and of a red colour. The colour of the COWS and the face, knees, and hocks, sometimes approach to black. The BULLS are nearly the same, but are also generally dark in the forequarters, and mottled on the sides and back .-The OXEN are often long in the Coat; and a glossy mahogany colour, with waving curls, is held in great esteem.

Memoirs of the above named Foreign Society, eyethere is a light ring. The horns taper to a printed at Bruxelles.

It will appear that this building was destroyed, and intended to be destroyed, by being on fire on the outside as well as within; it was not made fire-proof.

[†] For the authorities for these particulars, see 1st. B'p. Tomline's life of Mr. Pit: 2a. The English Annual Register; particularly for July, 1774: 3d. Any white, except on the tip of the tail, is The Journaux des Scances for November 11, disliked by the Breeders, from its being suppo1777, and May 7, 1779, and vol. 2 and 3 of the

in the neck. They are also wide across the hips will then be gratified.' and bosom. Their back is straight, and the tail is small and set on very high. They are thin skinned, and silky in the handling. The general height of the Bull is from 12 to 13 hands, of the Cow from 11 to 12, and of the Oxen from 14 to 15.

The Devonshire Cattle arrive at maturity sooner than most other Breeds, and the full grown Animals are so valuable, that few of the Calves are killed. For usefulness in Agricultural Labors, the Oxen are held in the highest estimation. They are well fitted for draught, both as to hardiness and activity.

The average quantity of Butter produced by the COWS is from seven to ten pounds per Week, though some have been known to yield as much

as thirteen or fourteen.

BINGLEY at page 120 of Vol. 3, of Useful Knowledge says, those called the Devonshire Cattle are adjudged to be the best of any.

These Cattle are thin in the Face, fine in the Mr. COKE, were becoming the favorite stock. Chops and Bone; clean in the Neck, and wide in the Hips. The Devonshire Breed is justly regarded as one of the handsomest, and at the same time most profitable which are reared in Britain.

The Farmers said their pastures would carry more Devons than Suffolks, which had been hitherto their favorite Milch Cows; and the Farmer's Wives were now giving them the prefuge may serve as a useful lesson.

They fatten early, and on the most valuable erence for the Dairy.

Mr. Bloomfifld's Dairy of 20 Head (12) parts, and are admirably fitted for draught: and

The DEVON OXEN are mostly yoked at two week. or three years old, and lightly worked. Their Mr. Coke's Balabour is increased at four: and from that period ced 15lb. a week. to six they are fully worked. Worked Oxen of this valuable Breed attain a larger size than those which are not worked, and at six years old they mostly finish their growth. In excellence of Oxen in Britain. No other kind ought to be used Beef, Mr. BINGLEY states, the Devonshire Ox- for the plough. en can scarcely be exceeded; and it is a remarkfrom a distance of considerably more than one had been worked so late as the preceding spring.

Their skin improves much in tanning, and their Tallow is of a peculiarly good quality.

generally commanded the best prices at Smith-city.—Edit. Am. Farmer.

J. S. SKINNER, Esq.

On the Formation of Mortar.

TO THE EDITOR OF THE AMERICAN FARMER.

Sir,-Among the many valuable papers contained in your volumes, there are few which merit the attention of your readers more than the remarks of Professor Olmsted, on the subject of lime as a cement, published in your last number. Lime is an expensive article in a building of brick or stone; and the apprehension of this expense has frequently prevented or delayed many useful improvements in our towns, and in the country.—
If it can be established that less than half the quantity usually employed will make a better and more durable mortar, it may be expected that the owners of lots and lands will be induced to increase the value of their property, by the erection

of more permanent buildings.

Dr. James Anderson, of Edinburgh, several years ago published a treatise on this subject, with the same view which Mr. Olmsted appears to have entertained; and there is not perhaps any material difference in their opinions. What the true proportion of sand should be, it may be often the perfect or defective calcination of the stone, upon the purity or impurity of the lime, and up-on the quality of the sand. But to show, for it will certainly show, that much less sand is generally used than ought to be applied, an extract from the Essay of Dr. Anderson is inclosed. It is not intended to recommend these proportions to your readers; but to confirm the confidence which they may be disposed to place in the observations of Mr. Olmsted. This treatise was put into his hands three or four years ago, when the subscriber was about to set up some pillars of brick for a hay-rick. He read some passages to the ma-son, and prevailed upon him to be governed by his directions, in the formation of mortar. The lime from its manner of slacking and falling, appeared to be good; and he is persuaded that at least twelve bushels of sand were added to every bushel of lime. The mortar so formed was used upon the pillars, and all the interstices were filled up with it. The work appears to be excellent. A SUBSCRIBER.

Talbot County, Md. 2d April, 1822.

Extract from the Essay of James Anderson, L. D. F. R. S. Sc.

it contained eleven parts of sand to one of lime .-To this there was added between twice and

caustic part of the lime, and make his calculation accordingly. But it is hardly possible to suppose, that above one hundredth part of this has fallent at writer signed of the same or another, I do ring summer, and by the fall the ground had a not recollect) while treating on the same subject, good covering, which rotted on the ground during suppose, that above one hundredth part of this mass, independent of the water, consisted of pure to correct at once. caustic calcareous earth.

"But whatever was the exact proportion of caus- as being able to produce the more immediate ferin proportions expressed, and was employed for pinning the outside joints of the stone-walls of a one pound weight of the mortar.*

" Had this mortar been employed in building a to doubt but it would in time have become as

firm as the stones of the wall itself.

" From these considerations, we may clearly see, that it is impossible to prescribe any determinate proportion of sand to lime, as that must vary according to the nature of the lime, and other incidental circumstances, which it would be tiresome to enumerate, and which would form an infinity of exceptions to any general rule.

"But it would seem, we might safely infer, that the moderns in general, rather err in giving

too little sand, than in giving too much.

" It deserves, however, to be remarked, that more intimately blended with the lime, than can possibly be ever effected by any mechanical operation—so that it would be in vain to hope to make good mortar artificially from pure lime, with such a small proportion of caustic calcareous matter, as may sometimes be effected when the lime naturally contains a very large proportion of sand. But there seems to be no doubt that if a much larger proportion of sand were employed, and if that were more carefully blenddifficult to ascertain; for this must depend upon the mortar would be much more perfect than ed and expeditiously worked than is common, usual in modern times.

"This I have tried experimentally, with the

desired success."

* In a note to a second edition of this work is the following addition :- " After seven years longer trial, the mortar still proves good and firm, and exhibits no appearance of ever falling.

> ---FOR THE AMERICAN FARMER.

On Ashes & Plaster of Paris,

Some weeks ago one of your correspondents to these manures when used in combination, and ments to determine whether they, or either of shioned way. them, acquired additional vigor from being unit-

tic lime, the mortar was made of these materials mentation and putrefaction of the vegetable matter in his soil. This theory of the modus operan-di of plaster, Sir H. Davy's experiments has comthe mode. I would prefer putting in the wheat the mode. I would prefer putting in the wheat upon corn ground. You will be pleased to excuse posed to every blast. It is now about fourteen does not seem to receive general credence. In the prolixity of the present, and believe me there has fallen to the ground, in all that time, good practice of Dr. Warfield "in leaving his ashes during the winter in the rains, in order that by the spring they may be sufficiently slack." thick wall, where it would have been suffered to would respectfully suggest, that whilst the Docdry slow enough, there seems to be little reason tor was communicating his valuable secret, he was at the same time propagating a very great error. For to preserve ashes in their greatest and most efficient strength to apply as manure; they should not be wet until they are laid upon the ground. Every rain whilst they are on the dung-hill, subtracts from their value, while it is not added to the field. They may be washed by the rain until all their constituent matter may be dissolved except the silicious. If the Doctor was afraid that the ashes would "burn" the corn, he might have used a lesser quantity, or placed them round the top of the hill. I have often used a shovel-full in this way, of the Doctor's "slack" the sand, when naturally in the lime-stone, is ashes, and never had the corn to burn from that

ENQUIRER.

DO-TO THE EDITOR OF THE AMERICAN FARMER.

I will state to you an experiment made on a small piece of ground, which goes to establish the fact, that plastering clover largely at the time of turning it down and preparing it for a wheat crop, is by far the most advantageous to the crop, and much preferable to turning in the clover, in the usual way and plastering on the surface, when the wheat is sowed, in the spring of the year. As I have stated in my last communication, the action of the plaster (thus excluded from atmospheric air) upon the clover, covered over, is instantaneous, and the putridity is so certain as to cause considerable gas, which in its passage through the clod, impregnates it with all its manuring qualities, and the root of the plant shoots down and feeds on a bed of manure, &c. About four or five years ago I purchased a small slip of land of Mr. William Patterson in Baltimore county, a part of which was old field, used by him only as a sheep pasture, because it laid so far from the main body of his land that it was no object with him to better its condition. This ground was originally good and of a kind soil, such as is published an article attributing wonderful effects understood to be real plaster land, but from constant cultivation for many years (probably before having myself acquired the practice in Lancaster he got it) had become quite exhausted, and pro-County, of mixing them for the purpose of conveduced what is commonly called poverty grass, niently damping the plaster, that no part of it so called from its being the meanest of all grassmight blow off while sowing, and being desirous to es, having very little vegetable substance in it, and ascertain whether this was the sole object among is generally found on soils which have been imthe Dutch for mixing, I instituted some experi- poverished by constant cultivation in the old fa-

"The best modern mortar I ever saw, was them, acquired additional vigor from being unit-made of lime that I myself had analyzed, and found ed; the result of which experiments I stated in a adjoining, and put it in oats. In the fall of the Three acres of this ground I enclosed in a field number of the Farmer, subsequent to, and in no-tice of the article above alluded to. My object ing two bushels of plaster to the acre on the povthrice its whole bulk of sand by measure; which then was not the pleasure of objecting or finding erty grass, which tas turned under as soon in fault, for this unprofitable office affords me no pleasure; but it was purely to correct what I harrowed it down; I then sowed it in oats, and its quantity by weight.

"Now supposing that every particle of that lime had been so perfectly calcined as to be in a caustic state, there could not be less than forty-seven parts of sand to one of lime. The reader may allow what he pleases for the untered of the state of the same reasons, I now take the liberty of suggesting that a writer signed G. W. in your paper of clover however took finely and flourished well during that a writer signed G. W. in your paper of clover however took finely and flourished well during that a writer signed G. W. in your paper of clover however took finely and flourished well during that a writer signed G. W. in your paper of clover however took finely and flourished well during that a writer signed G. W. in your paper of clover however took finely and flourished well during that a writer signed G. W. in your paper of clover however took finely and flourished well during the same or another. I do ring summer, and by the fall the ground had a the summer or fall.) In the spring I again plaster-In the first place, he speaks of plaster of paris, ed it, with the same quantity, making in all stx

second crop was left on the ground as before. The larger than cabbage seed. following spring, I again plastered it, and the clover was very good—this crop I turned down grain of any kind, is not very productive on a en mass in the fall, first putting about two bushels poor soil. of plaster to the acre, at the time of ploughing under-it was then harrowed the same way it was ploughed, and sowed with wheat and harrowed in, and if the fly had not taken it should they speak of .- Edit. Am. Farmer. have made a good crop of wheat. Last fall, in consequence of a large quantity of blue grass appearing, I ploughed it down, intending to put in corn this spring, (first sowing on the stubble and grass about two bushels of plaster to the acre) and if it is a good season, expect to make 10 barrels of corn to the acre, with the assistance of plaster and ashes in the hill. I can aver that this spot of ground has had no other manure except clover and plaster during the time. This expebetter than when in its original state; in fact, I you must be careful to suffer no stock of any kind old ploughs into new, and find that in so doing, made, it will with care and attention, cost but little a boy of twelve years old. to keep it in good plight, and your crops in that the writer to impress on the minds of every north, which I think are in this improvement farmer, to plough his lands deep in the fall of the generally obviated. It is very light, strong, easiyear, as the most certain method to improve waste grounds, and is the best preparation he can be afforded complete, at five dollars each. give it for a summer's crop; the ground being in a loose broken state, absorbs during winter, all the plate, you are at liberty to give it a place in your rains and snows, which is of itself, in my mind, equal to a slight coat of manure.

>0< FOR THE AMERICAN FARMER.

Mr. Skinner: As millet had been highly recommended in your paper, I determined to sow a small quantity last season, and procured an half bushel of seed, the latter part of may. I sowed twelve quarts on the fifth of June, on about one acre; the latter end of August I mowed it, and let it lay a day or two without spreading. When it was sufficiently cured for hay, I had it drawn to the treading floor, and trodden with horses. I had ten bushels of seed, and four large loads of my ox cart of hay, and although it was not better than timothy, it was eaten heartily by my horses

I was much pleased with it during its progress, it came up quickly, grew rapidly, began to head in July, and was beautiful to view; I think it mould. would be profitable as a green crop for soiling.-It was sown too late I think, and had to contend with the crab grass, but it soon overpowered it, where it was soon thick enough. to be called, has not been properly estimated by writers who have mentioned it, for if my smal! season, at different times, and will give you the the corner at F is cut out, so as to admit its lower machine for a similar purpose.

We should be glad that writers about millet would always mention which species of millet

The Carolina Plough.

TO THE EDITOR OF THE AMERICAN FARMER. Raleigh, March 22, 1822.

Dear Sir,-I send you a draft of a newly invented or improved plough, which I am satisfied is in many respects, superior to any that I have had riment has convinced me that real plaster land, an opportunity of seeing used; having had one although worn out, may be reclaimed in a very short made about a month since, I found that a single time, by this simple process, and made to produce horse would break up an acre of what we call "old field" in less time and more easily, in one am convinced by turning in clover and plaster in of these, than two would do, in the " New-Engthis way, you may in a short time, make the land Coulter Plough," which I had before used. land too rich for wheat, and have a soil as deep as On ascertaining this fact, although in a season of you can plough it. To effect this in a short time, hurry, I immediately set about working up my MR. JOHN S. SKINNER. to range over or graze on it-it is true that this have gained at least one half in time. Besides my mode of improvement requires patience, money, old ploughs were so heavy as to require a man to labor, and time, but in the end, when your soil is manage them, while these are easily handled by

There are objections to the use of the Freeborn state, will amply remunerate you. It is the wish of Plough in the south, not existing perhaps at the ly made or repaired by a common smith, and can Acts, is-

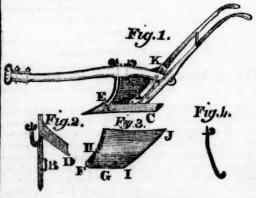

Fig. 1. Represents the plough entire. Fig. 2. Gives nearly a top view of the land side,

wing and front bar. Fig. 3. Presents the back view of the sheet iron

Fig. 4. A stay rod. The land side is made of a bar of iron two inches wide, and sixteen inches long; this is brought to let was taken off, the ground ploughed very mel-fig. 1; the loop B, fig. 2, is made of iron 13 inches wide, and welded to the upper edge of the land Ithink this grass, or grain, or whatever it ought side, leaving half an inch for the stay rod to pass through and hook underneath it.

bushels of plaster to the acre, in that short time result in the fall. I would advise every farmer to edge G, beneath the upper edge of the wing Wanting grass for my stock, I cut the next crop, sow a small quantity, and judge for himself, of while the end H rests on the front bar to which it which yielded more than a ton to the acre—the leaves the le are made, one at I, corresponding with D, fig. 2, another at J, by which it is fastened with a small nail to the handle.

Fig. 4. Is a small rod passing from C, fig. 1, through the loop B, fig. 2, to which it hooks, also through the foot of the left handle and beam, and is strained by a screw at top. The right handle should be bent at K, fig. 1, to spread the mould, and curve the upper extremity of it a little forward. A little of this handle should be cut out below, to give the mould a slight concavity.

When together, the beam rests on the mould, keeping it firm in its place, a wrought nail is put through the wing, mould, and lower end of the right handle, and turned just enough to keep it from falling out, which is sufficiently strong and more convenient than a screw bolt.

I will here acknowledge that in forming the mould, I am indebted in a great measure, to the remarks of Mr. Gideon Davis, on the horse and plough, in the 29th No. of the American Farmer, In the principle of which I most fully acquiese.

I am, respectfully sir, Your constant reader, J. H. HASSAN.

>0 From the London Farmer's Journal. TURNPIKE ROADS.

ANIMAL COTTON.

BLADENSBURGE, October 19, 1821.

Sir: I send you a curious bunch of cotton, found growing on a vine, in my overseer's garden, the worm which appears to have spun it, is enclosed in one of the bunches; perhaps, some of your Botanical friends, may be able to designate, Beware of Chalybeates. what class, or genus, it belongs to,

Respectfully, sir, Your's, &c. &c. A CONSTANT READER.

MR. SEINNER.

The above was sent with the cotton, to Reuben

MR. R. HAINES: The cottonlike substance received from Mr. Skinner, which you submitted to my examination, is of a beautiful whiteness and remarkable tenuity of fibre.

Int first supposed it to be the production of an extraordinary assemblage of a species of insect of the genus Psylla of Geoffroy (Chermes Lin.), the cottonlike vesture of which, it very much resembles.

On separating it, however, to discover what Mr. Skinner's anonymous correspondent, regards us " the worm which appears to have spun it," I observed the mass of small coccoons, closely compacted together, arranged somewhat symmetrically, and intimately adhering in every part of this exterior surface to the cotton or silky matter. I had now no doubt as to the fabricators of the mass in question, which are certainly no other than the imperfect and numerous progeny of a species of the genus Ichneumon of Linné; which had been deposited by the parent, within the body of a caterpillar, and which having attained their full growth had pierced the skin of the catterpillar, and formed this delicate covering to protect them in that inert state which precedes their ultimate form.

This species, so truly remarkable for the great abundance of the silky secretion with which its coccoons are enveloped, may at a future day supply a particular and costly manufacture, notwithstanding the difficulties which would attend its artificial propagation.

For an account of a somewhat similar insect. and of which the manners and habits resemble those in question, I must refer you to " A memoir on animal cotton, or the insect fly-carrier," by Mr. Lozieres, in the 5th Vol. Amer. Philos. Trans. p. 150.

Your's respectfully, THOMAS SAY.

AGRICULTURE.

The Cottager's Manual,

FOR THE MANAGEMENT OF BEES THROUGHOUT EVERY MONTH OF THE YEAR.

[CONCLUDED.]

SEPTEMBER.

To those persons who follow the humane system of depriving their hives of part of their store, this month is one of the most busy and important carly swar of the whole year. The instructions for depriv-This is an excellent season for the establish-ceptible on the ground, but not one presents it-phlet published for the use of those who adopt the Huish hive, that a mere repetition must appear the best criterian by which the best criterian by which the best criterian by which the product of the best criterian by which the season for the establish-ceptible on the ground, but not one presents it-bive is now easily determined, and the weight is ment is necessary to determine whether the Huish hive, that a mere repetition must appear profix and extraneous;—it should, however, be the best criterion by which the purchaser can drones are no longer in the hive, for the propriette study of the humane apiarian to ascertain, direct himself; a considerable distinction must tor may say, "I have not seen the drones kill-however be made between a swarm and a stock ed," and he may thence conclude that they are this month, the exact time when any of his neighbors intend to suffocate their Bees, and as the Bees themselves cannot be of any use to the sufis included Bees beyond, the heaviest substance in kindly saved the Bees the trouble of killing them. focator, either to beg or furchase them. It may a hive and many persons who take the weight of It must, however, in order to determine the appear singular to recommend, or even to mention the hurchase of that which is in itself, to the proprietor, of no use, consequently no pecuniary value can be attached to it, but such is the perverseness of human nature, that the commodity which, comparatively speaking, is of no value, becomes immediately invested with it, at the instant that it is sought for by another. I have had too many instances of the truth of this remark to the Bees. There is not a more dangerous thing to the beath of the proprietor may assure himself that some rato many instances of the truth of this remark to doubt it for a moment, and particularly in regard to the Bees of a hive intended for suffocation. An increase of numbers is in most cases highly advantageous to a hive, and I may say inhighly advantageous to a hive a first succession of the most severe disorder with dical defect exists in the hive to the health of the Bees, than infected Bee-bread the proprietor may assure himself that some ratio singhly advantageous to a hive, and I may say in deed in every case, where the proprietor is convinced that there is a sufficiency of food in the hive for the support of the united population, or who may be willing, in case of a deficiency, to support them by feeding. With this view, have always solicited the cottager, beat on the sufficient of the inverted the cottager, beat on the sufficient of saving the five solitager to have the first swarms. A gentleman should be the proper than the saving system, to allow me to take his Bees from the hive, thereby enjoying the double satisfaction of saving the lives of the Bees, and adding to the strength of my own hives; but although the very hole be dug, in which the poor insects are to be buried, and the match lighted which is to consign them to instant death, the interested and avaricious individual immediately discovers an intrinsic value in the Bees, and demands an exorbitant price for that, which in a few moments cannot possibly possess any value I am well aware that upon the true principles of political economy, the proposition which I have just advanced is not tenable, and that an equivalent is always due for that, which in a few moments cannot possibly possess any value that where are few gentleman who are able, or disposed, to detect the imposition, he recives the stipulated price of this second.

I am induced, from repeated experiments, to give it as my decided opinion, that the Bees warm in the gentleman who are able, or disposed to a muse the discover and the appointed place, and with the knowledge that there are few gentleman who are able, or disposed, to detect the imposition, he recives the stipulated price of the first swarm, and the sale of his second, a first swarm, and the sale of his second.

Bees is as nothing in the eye of him who is going to suffocte them, but the very request for them of the drone are few gentlemans hive, hastens with it to the work of the care of the drone are few gentlemans and the proper time of the drone are few gentlemans a to suffocte them, but the very request for them sets the most powerful principle of human nature in action, and the cottager, looking anxiously in your face, immediately asks, what will you give me for them? It is in vain to argue with him, that as the Bees are of no value to him, he ought to this certainly cannot be controverted by any logied to ascertain the cause of this singular properhis hives for the winter, in order to prevent the
cal deduction, and I am not able to quote many insity of the second swarm, but I can attribute no other
tances in which I could obtain the Bees as a gift;
but I would advise the considerate apiarian rathere to give a trifle than to lose the golden opportunity of enriching his own hives, by such a vatunity of enriching his own hives, by such a valuable addition to their numbers. The junction sible space in which their labors can be carried on.

of two hives is by no means attended with that Particular attention must be paid to chose haves difficulty which many persons attach to it, nor is which have not killed their drones. done as they present themselves at the entrance of

One of the chief occupations during this month, is the feeding of the weak hives. Persons who when the hive has a superabundance of food; but, and the Bees, on examination, will be found dead. I would advise the hive, if it be a new one, to be the great advantange which is derived from a liberal system of feeding, and it may be affirmed without fear of refutation, that there is not any department in the whole range of the apiary, in which keepers of Bees in general are so wofully off a branch, and having scooped out the pith of it, fills it with raw sugar, and inserts it at the entrance of the hive. This system is adopted at all seasons, and in all weathers—the Bees are accidentally observed eating the sugar, in the same manner as a hungry man is not very choice of the victuals which are set before him, and the cottager immediately concludes that he has fed his Bees; and should they survive the winter, he sagaciously concludes that it was the raw sugar that saved his Bees—a liberal supply of boiled ale and sugar, will save many a hive, that would inevitably die upon the mere food of raw sugar; and in this month, whatever hives appear weak, let them be bountifully fed—choose a fine day for the purpose, when the Bees are on the wing—certainty exists of a superabundance of food more than the hive which had been kept warm, had been kept warm, had been kept warm, most destructive to the hive, hving on the noney and wax, the utmost precaution is necessary to prevent its getting a footing.

Particular care must be taken this month, that the hive which had been so kindly nursed, that the hive which had been kept warm, and wax, the utmost precaution is necessary to prevent its getting a footing.

Particular care must be taken this month, that the hive which had been so kindly nursed, that the high winds which often prevail, do not overther that the hive which had been so kindly nursed, the high winds which often prevail, do not overther the hive which had been so kindly nursed, the high winds which often prevail, do not overther the hive which had been so kindly nursed, the hive which had been so kindly nursed, the high winds which often prevail, do not overther the hive which had been so kindly nursed, the high winds which often prevail, do not overther the hive which had been so kindly nursed, the high winds which often prevail, do not overther the hive which had been so kindly nursed, the high winds which often prevail to the hive which had been so kindly nursed, the high winds which often prevail to the hive which had been so kindly nursed, the high winds which often prevail to the hive which had been so kindly nursed, the high winds which often prevail to the hive which had been so kindly nursed, the high winds which often prevail to the hive which had been so kindly nursed, the high winds which often prevail to the hive whi the purpose, when the Bees are on the wing—
place some plates full of the syrup before the hives, and the Bees will soon regale upon it—
they will carry it to their cells, and in the winter

In treating of the effect of cold upon the hives, now take shelter under them, a

and making due allowance for the weight of the hive and the Bees, an estimate can easily be made of the actual quantity of honey. This should always be the foundating and rule of the system Bees, it is probable I should have lost some of feeding, and the judicious manager will always my best hives. Towards the close of February, make an allowance for the openness or rigor of 1820, a most severe second frost set in, my Bees, the season. In an open season the consumption from the lateness of the season, were taking eve-

The covering should be cut close to the stool on only in a state of torpor. I therefore collected all ther the better. Every thing which tends to diswhich the hive stands, and there should not be the Bees; and carried the hive into the house, unite the Bees in cold weather, proves highly inany object behind, which could serve as a con- and placed it at a moderate distance from the jurious to them, for as they are kept alive in winany object behind, which could serve as a conductor to the insects. Cleanliness is one of the fundamental pillars of apiarian science, and alreturning life exhibited themselves; and in though some cottagers conceive that a pigstye is less than two hours the complete resuscitant excellent place for Bees, from an erroneous tion of the Bees had taken place, and I had notion that they are particularly partial to the balsamic odour of a piggery, yet the second year will convicte them of their error, if conviction and in vigor. I fear that the same circumstants of their error, if conviction and in vigor. I fear that the same circumstants are presented to state the same circumstants.

admit only one Bee at ouce. All dampness should be carefully removed from the hive—it is highly injurious, and will ultimately prove their ruin.

NOVEMBER.

The chief occupation of the apiarian this month is the visitation of his hives. In a healthy hive, an evident decrease will be manifest in the consumption of the hive; and due care should be taken that all chance of death by famine should be averted. It is the principle of many persons, but it is founded on erroneous ideas, that Bees benumbed by the cold, and that Mr. Kin ought to be kept warm during the winter; and they were dead. It is an unheard of the "gude wives" of the country bestow particu-

health of the hive, to cleanse the pedestal, sprink-ling a little sait upon it, this will tend considerably to the health of the Bees: contract the entrance, and plaster the hive to the stool.

OCTOBER.

One of the chief occupations during this month, is the feeding of the weak hives. Persons who have the hive has a superabundance of food; but, and their internal health minutely ascertained. The late swarms should have particular decorate the hives, and keep the "poor insects" warm, during the inclemency of the winter: this is all very humane and good-hearted, and I will management, that some hives will fail this month, is the feeding of the weak hives. Persons who when the hive has a superabundance of food; but, and the Bees, on examination, will be found dead. when the hive has a superabundance of food; but, the victuals which are set before him, and the cot-tager immediately concludes that he has fed his found that the hive which had been kept warm,

In treating of the effect of cold upon the hives, t would be running in the face of all experience months it will supply the place of honey.

It would be running in the face of all experience to say, that cold has no effect upon Bees. I am the season. In an open season the consumption of food is greater, and therefore a more liberal supply ought to be given, but it is at all times better to give an abundance at once, than to administer it by driblets.

The covering of the hives must now be particularly attended to, the common straw covering is the best, provided, as is generally the case, it be not made to reach the ground, by which the insects and mice are able to ascend into the hive. I examined them, and found the Bees clustering on the combs, and to all appearance dead: I was aware that Bees never cluster in a dead state, but the covering should be cut close to the stool on only in a state of tornor. I therefore collected all will convince them of their error, if conviction or particular points can be ever imparted to them—for I never knew an apiary prosper which was placed over a pigstye; on the contrary, the second or third year, at furthest, the Bees dwindled away, or forsook the hive.

The entrance must now be contracted, so as to admit only one Bee at once. All dampness should be carefully removed from the hive—it is highly injurious, and will ultimately prove their ruin. covered.*

The hives should be carefully visited this

* In a letter recently received from Mr. King, Brill, Bucks, he mentions having lost a hundred and fifty hives by the dysentery; some strong suspicion rests upon my mind that the Bees have been benumbed by the cold, and that Mr. King concluded they were dead. It is an unheard of mortality

and the Bees, on examination, will be found dead.

every method be adopted of preventing its admission. So eager is this little animal to shelter itself during the inclemency of the winter in a Bee hive, that it will frequently gnaw the band of straw in order to obtain admission, but as it is most destructive to the hive, living on the honey

Examine the tops of your hives—the vermin now take shelter under them, and by degrees insinuate themselves into the hive. A prevention is in all cases better than a remedy, and were this maxim to be adhered to more punctually in the management of Bees, the success would be great

er, and the profit more abundant. DECEMBER.

This month may be considered as entirely passive, on the part of the apiarian; the cold is, in general, too intense to admit of any operation being performed on the hives, should any be requi site, but excepting it be a casualty by an over-throw of the wind, or some other untoward acci-dent, the apiarian will have little more to do this month, than to take a cursory survey of his hives, protecting them from snow, and prohibiting his Bees from leaving the hive. Let it be considered as a standing rule in the management of Bees, that the less they are molested or examined in cold weater by a reciprocity of animal heat, nothing should be attempted, which has a tendency to diminish the temperature of the hive.

The greatest danger which impends over a hive this month, is the snow; never let it rest on a hive, and confine your Bees during the time that

it is on the ground.

* In the middle of December, during an intense frost, I opened one of my most populous hives, and inserted a small thermometer in the most crowded part. The thermometer previously to the insertion was ten degrees below the freezing point at eleven o'clock, A. M. I suffered the thermometer to remain ten minutes, and on taking it out, it stood at ten degrees above the freezing point, making a difference of twenty degrees between the internal and external temperature of the hive. A Bee becomes benumbed in a temperature of two above the freezing point.

204 Cotton Seed Oil.

Every planter in the Southern States is interested on this subject. Millions of bushels of cotton

seed are annually converted into manure, for which it is intrinsically worth about twelve and a half cents a bushel. There are probably about three hundred thousand bags of cotton, averaging about two hundred and fifty pounds each made in the U.S.—for each bag there is about thirty bushels of seed of 25 pounds to the bushel, left on the plantation, which at the above rate, would amount plantation, which at the above rate, would amount to a little short of four dollars worth of seed as it is heated; and by carrying off the principal for each bag of cotton. By the following statement from Massachusetts, it appears that a bushel of seed produces seven pints of oil; bers fall upon it. 2d. A red hot cinder of fossiland that the remainder of the seed is equal coal (here called sea-coal) may be laid on a fine in value to corn meal for feeding cattle. It is probable that a bushel of seed, even measure, light from the gin, would not be more than two-thirds a more serious investigation than it has yet met ment. with in the Southern States.—Pee Dee Gazette.

[CONCLUDED.]

In treating of the best method of preventing damage to buildings from fire, we shall employ none but popular language; for what concerns all, should be understood by all.

We shall lay down our principles also as briefly

at

at

al

1st. Heat may be considered for our present purposes, as divided into the heat of flame, red heat (which belongs to heavy bodies,) and what we shall term dark or dull heat. As to radiant heat (so called) we shall soon find that it has as little concern with our present subject, as dark heat. 2d. Flame does not issue from heavy bodies, till these bodies have lost more or less of their original texture; for as flame consists of in-flamed vapor or gas, this must be produced be-fore a body can be said to be in any part inflamed. As flame has thus its beginnings, if we can pre-vent these beginnings, we shall prevent flame: for as to red heat in wood, it is the mere conse-Atmospheric air has several properties, which require it to be noticed here: for when pure, this air feeds flame; when impure (or spent,) it extinguishes flame; when its bulk is increased by heat, it tends to ascend and to carry away heat in many cases; and it is lastly a bad conductor of all kinds of heat. 4th. Lord Stanhope's layers of plaster then have several important operations.— They prevent the commencements of inflammation rom occurring in what is placed behind them; they shut out the circulation of fresh air: they are bad conductors of heat; and by helping to inclose layers of air, (which we have said is another bad conductor of heat,) they increase the impediments to the progress of conflagration. Plaster, we remember, is chiefly made from lime and sand, (that is, from incombustible stone;) and being turned back again into stone, when brought into the shape of well formed mortar, it is wisely embers of radiant heat and radiant light.

In addition to these general principles, there are a few independent facts to be brought into view to add force to our explanations. 1st. When a fire is kindled on the surface of snow, cold air smooth cold iron borrowed from the laundry-for of a bushel, after being packed and transported the points of the cinder which rest on the hand-render the conflagration rapidly universal through

siderable quantities, but there is little flame.— Fresh air however being permitted to enter by the opening of a door, the fire is enabled to con-Fresh air however being permitted to enter by the opening of a door, the fire is enabled to convert into flame, all the smoke which it has created; and the fire soon increases its intensity.—But still, let the sides and ceiling of the room be covered with plaster, and let the foor also have plaster immediately below it; and the damage will not be serious, if the inflamed materials do like to walk upon boards. But it is plain that not exceed a certain amount, and do not remain this part of the house deserver perficuler evaluation. not exceed a certain amount, and do not remain this part of the house deserves particular study too long unmolested: and provided also that their and that it may be treated in various ways accominfluence does not reach to other places unpro-panied with little expense.

tected by these safeguards.

the air which it accompanies. Nor does it par-ticularly attack the sides of the room especially if of plaster; for these are upright, and the flame merely moves in lines parallel to them.— The floor on the other hand if inflamed, has its The floor on the other hand if innamed, has its flame perpetually lifted off from it by the ascending air; without which air it cannot long remain inflamed. Radiant* heat also has little effect either to begin or to continue inflammation; or it would more readily melt snow, or burn a cambric handkerchief or the wick of a candle, than we sleep undisturbed with the fear of fire. handkerchief or the wick of a candle, than we find to be the case under the circumstances above mentioned. Thus we see on what simple measures in general the safety of a particular apartment

ployed to assist in dividing room from room, and may be made to rest, if we bestow due attention floor from floor; in order to confine the inflammation to the spot where it originated.

The ployed to assist in dividing room from room, and may be made to rest, if we bestow due attention to it; particularly, as after a time we may generally expect assistance from without to subdue rally expect assistance from without to subdue the fire. Still however a number of precautions are to be observed, which we proceed to enumerate.

1st. Lord Stanhope mentions one mode of protecting a stair-case; but he does not shew the great importance of providing this protection, nor give a choice of different modes of effecting it.

must supply both deficiences.

Dr. Franklin used to observe in conversation. coal (here called sea-coal) may be laid on a fine that the English made uhright tubes through their cambric handkerchief, without even scorching it, houses, in the form of stair-cases, which they provided the handkerchief be stretched on a covered with combustible materials, calculated to spread a fire from story to story; and thus to of a bushel, after being packed and transported to Massachusetts; it may therefore be reasonable to Calculate, for each bag of cotton of two hundred and fifty pounds there is produced twenth to bushels of seed, that will yield one gallon each of oil, and that the seed meal will be equal in value to corn meal. If the oil is valued at one dollar a gallon, and the seed meal at thirty cents a bushel, instead of about four dollars for that which falls from each bag or bale, at least twenty six of oil making, of twenty-two dollars on each bag of cotton; and one crop in the Southern States,—Pee Dee Gazette.

The points of the cinder which rest on the hand-kerchief immediately become chilled, in consequence of heat being conducted downwards by the solid pieces of two being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its being carried upwards by the iron below or of its easily destroyed by flame; but two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two solid pieces of wood bedded in mortar at least or two s with in the Southern States.—Pee Dee Gazette.

Let us now make a direct application of our principles and facts to the case of fire acting on buildings.

Remarks on the means of preserving inhabited buildings, in which much wood is employed, from destruction by fire.

Lord Stanhope's.—As to the iron railing, some may object to it, on account of its giving passage to lightning, when not connected with a lightning rod; besides, that a wooden railing is easily struck away with any heavy or sharp body in case of fire, to prevent its serving as a means of communicating flame from one story to another.

3d. The floors of the upper parts, and often of Again: to know the course of the flame, we must know the course of the air; for the flame floats about only by means of the air in which it swims; moving precisely as that air moves.—
This air then by its heat rises; but still not so obstinately, but that it seeks to escape by doors, by windows, and by the chimney. The flame therefore does not particularly attack the ceiling which is incombustible, and affords no outlet to the air which it accompanies. Nor does it particularly attack the sides of the room especially of the lower parts of a house, and especially of kitchens, &cc. in various countries, are covered with bricks, tiles, or stucco; and where fires are constantly kept, are very warm, especially estated with mats or carpets in winter. If left too rough, carpets put over them wear out faster than may be wished; but the French who tile many of their apartments and bed-chambers with care, and cover them with a preparation of the air which it accompanies. Nor does it particularly attack the sides of the room especially conveniences of this sort.

Some may prefer the neatness of clean or paint-ed boards to these coverings, for stairs, passages, and apartments; but they should know what

Accordingly Dr. Franklin used to remark, that in France, fires were commonly confined to the mere furniture of a single apartment; but that in England, they often extended to streets; and in the United States, he might have added, they sometimes destroy whole portions of towns.

4th. Partition walls running from the bottom of

a building to its roof, are of great utility, (made either of plaster 'according to Lord Stanhope's

keep Bees appear, in general, not to be aware of the great advantange which is derived from a li-beral system of feeding, and it may be affirmed without fear of refutation, that there is not any department in the whole range of the apiary, in which keepers of Bees in general are so wofully off a branch, and having scooped out the pith of the purpose, when the Bees are on the wing—certainty exists of a superabundance of food being rope, or a few stakes would have defied the place some plates full of the syrup before the in store; but to a poor hive it is only increasing strongest wind that ever blew.

Examine the tops of your hives—the vermin they will carry it to their cells, and in the winter months it will supply the place of honey.

and making due allowance for the weight of the able to adduce an instunce, in which, had the maxim to be adhered to more punctually in the hive and the Bees, an estimate can easily be made circumstance not occurred to myself, and I was at management of Bees, the success would be great of the actual quantity of honey. Plaster is not expen- not have their floors of wood. sive; and against its expense we must set that of our clap-boards and the paint bestowed upon them, and the protection received against fire. The beauty of plaster certainly gives it another advantage not only over clap-boards, but over bricks, as may be seen in some of the late buildings at Richmond in Virginia; and the durability of the plaster at Richmond shews that it can be made to defy frost. Plaster requires three things; first, to be well made; next to be laid on in thin coats; and lastly to find a building of which the foundations, as well as the wood-work,

are firm. 8 If the foundations of a building be not rendered immoveable by their depth and solidity, and if the timbers are not kept from warping; merchantmen; and should now enter our buildings on terra firma. MR. CURWEN'S STATEMENT OF THE EXPENSES OF SOILING.

Schoose Farm, Dec. 4, 1821.

SIR,-I embrace the first leisure moment to comply with your wish for information on the

expense of preparing steamed food for cattle.

The cost of the apparatus may be esteemed more considerable than it actually is; I think it expedient therefore to state the expense of a steaming apparatus adequate for supplying food for 100 head of cattle and 50 horses.

The water is boiled by steam, which is introduced into the boxes by iron pipes. It requires a strong power of steam to heat the water quickly and prevent its being smoked, which renders it

The capacity of the boiler is a thousand gallons; first cost, setting, &c. about sixty guineas. 1. Our ancestors talked of smoke balls for ex- It is capable of working three stone boxes, five tinguishing fires; which must be of great use be-

ard Seppings has taught this secret to the natives muddy water is said to be more efficacious in putter wheel the Swede turnips. Six boxes are of the world, and it will ultimately spread to our fires, than water which is pure. 3. Wet steamed five days in the week, and nine on the mops, with long handles, are good for shingled Saturday for Sunday's food. The boxes are filroofs: and large tin squirts are useful for the led one third with water, from 25 stone to 30 of same purpose, and for crooked places. 4. A lit-chaff, (husk or grain) and about 30 stones of cut tle sand is no mean thing to keep at the top of a Swedes. When completely boiled, which, when floors after the lapse of a few years: and yet house, ready to be wetted, in order to extinguish the steam is completely up, may be an hour and much of the use of plastering as a preservative fire, or stop up smoke-holes. 5. Wet blankets a half, the drinks are lifted into iron boxes; the against fire is lost, if the plaster be not solid and put before chimney places, have often been effi-contents, without the liquor, may exceed half a cacious in putting out fires in chimnies. 6. Small en- ton. Iron boxes are used for receiving the drinks, 9. The union of dwelling houses with outing befound better to obtain these conveniences, but it will be found better to obtain these conveniences by passages, which can easily be torn downline as they prevent the serving the drinks, and the breaking up of water-lines, the rate of four ounces to full grown cattle, and

Two killed last month, may be grown upon one square yard, weighing together 14½lbs. hence that about 31 tons shall be together 14½lbs. hence that about 31 tons shall be ted (be it remembered that I am going upon sup-20 weeks? and what, by consequence, will be a fair valuation of the crop? This question I answer by P.'s report, who says, that he gave to each sheep 25lbs of the roots per day (if I answer by P.'s report, who says, that he gave to each sheep 25lbs of the roots per day (if I answer by P.'s report, who says, that he gave to each sheep 25lbs of the roots per day (if I answer by P.'s report, who says, that he gave to each sheep 25lbs of the roots per day (if I answer by P.'s report). ed weekly, two thirds of better coal would do the each sheep 25lbs. of the roots per day (if I understand him right,) and therefore, with this quantity, an acre would suffice for 20 sheep. Now, as 6d. per head per week for sheep at Sweedish turnips has lately been a low price, I shall take 6d. for my calculation, and so make the acre of mangle wurtzel worth £10, allowing their comparative value to be equal, (an acre of Swedes will, I know, keep 20 sheep 20 weeks without hay, though not a first rate crop:) here then is £10 in roots. But we have now a more important article to notice, namely, the hay which P. has nearer in quantity to the other. thought necessary for each sheep, viz: 5lbs per day; thus consuming, with 20 sheep, 61 cwt. per week, which, for 20 weeks, I value at £25. It must now be asked, in what way 20 sheep can be make to leave a fair profit, having consumed in 20 weeks £35, worth of food, besides the labor in preparing it? I answer, by P.'s method, and success only. But it has occurred to me, Mr. Editor, that I may have mistaken P.'s statement, and that, instead of 25lbs. of roots per day for each cept, as I before observed, that the red were plantsheep, he means 25lbs per day only for the 8 sheep; though, as the difference is so great, I After this statement, the question that would am frightened back to my former construction of his letter; indeed, the latter quantity cannot I tle in? I would be the last person who would think, be sufficient, though the former appears far beyond probability. Without farther comfidently state, of the many visitors to the Schoose, ment upon the quantity of food necessary for sheep. I shall just state, that 230 lamb-hogs, and 40 old sheep of mine, are now doing well of the whole stock. I am, with much personal with about 2400lbs. of Swedish turnips per day and 250lbs. of oats and cut straw mixed; by which N. B. No credit is taken for the fuel consumed, it seems, that not quite 10lbs. of food is the average quantity consumed by each sheep per day .-My wish has been to over rather than under rate the expense. Neither hay, corn, nor cake, was my report with that of P.'s, will perhaps observe, that mine is accompanied by the signature of my name. If P. means to say, that his sheep were fed with 3lb. 2oz. of mangel wurtzel, and 5lbs. of hay (a quantity of food approaching near to mine,) instead of 25lbs, of that root, then I call it feedland, where upwards of 100 cows are sustained on ing with hay and not with the roots. I have now steamed-food. An exact account of this establish-only to return to the weight said by P. to be adment, with drawings and details, expenses and ded to each sheep in a given time, namely 32lbs. in 5 weeks, which strikes me with wonder, knowing as I do that the five best grazing months, commencing with May, will produce at grass no greater weight, taking the average of 100 sheep, though they shall be of the most thrifty sort: and further, that an increase of weight, in pro-

ING AFTER TURNIPS.

NORFOLK, JAN. 6, 1822.

SIR.

three sorts, one which I have had long in my possession, and on which I mainly depend; another, of very great size, given me by a friend; and Phillipps's red, which you procured for me in the spring of 1820. In that year the produce of the red was very inferior in quantity to the other; but observing that it produced very little top, at most not half so much as the other. I determined to give it another trial, and to plant the sets in every way closer, and which appears to have brought i

With the mode of preparing the land, I shall not trouble you. It was alike in every respect, and what difference there was in natural quality, was in favour of what I shall call No. 4, and gradually decline to No. 1. The potatoes were planted in two broad ridges, or warps, adjoining each other; the sorts separated by the furrows, and the whole done by the same two men, in the same manner, and as near as possible at the same time, exed twice as thick as either of the others.

No. 1, was planted with my own sort, large potatoes, in cuttings containing two or three eyes each, and occupied ------No. 2, the same sort whole, but smaller 0 1 No. 3, the large potatoes I had from a friend, cut to two or three eyes -

0 1 9 No. 4, the red, some cut, some whole No. 1, produced 423 sacks, or 160 sacks per acre, the potatoes larger than those of No. 2, and

in every respect better. No. 2, produced 40 sacks, or 145 \frac{1}{2} sacks pr. acre.

No. 3, 30 sacks, or 104½ per acre. No. 4, 34½ sacks, or 113 per acre; but if we subtract the extra quantity of seed used, to say nothing of double the expense of planting, it will reduce the produce of No. 4 to 105 sacks per acre.

acres. I commenced feeding twenty Scots and twenty heifers with them, about a fortnight ago.

Much has been said in your paper of ploughing, or not ploughing land, immediately after the tur-nips have been fed off. I shall do this year just the same as I have done for some years past,plough for my barley much less than my neighbours do. I have now a piece of 28 acres cleared. As soon as it be dry enough, and not too dry, I shall plough it clean, and at a moderate depth. A

periments, who appears before us with the signature of P., in your Journal of December, the six roots, which, at only four lbs. each, gives more than 53 tons.—Edit. Farm. Jour.

* It deserves to be proved by experiment whether potatoes which give large tops should not be preferred on dry soils, and those which give short tops, on rich and mellow soils.

short while before seed time, I shall harrow it, first with rank, and then with finer harrows, roll it with a light roller, sow the seed broadcast, and plough it in with our light one horse ploughs, made and used for that purpose only. In this way, put in about 140 acres last year, and nearly the the like quantity annually for some years before. I am satisfied that the less you stir your land, the better your chance of a crop of clover, and therefore I always sow trefoil after potatoes, because the culture, takingup, &c. of that root, necessarily renders the land so much more loose. I am satisfied it is still more requisite to plough very little for barley on strong land, provided that ploughing be given when the land is exactly in the state to receive it. I was obliged last Michaelmas to take a heavy land farm into my own occupation, where, if I can, I will plough but once, sow or drill, and harrow in. I will wait aimost for ever, rather than plough when the land is not in gift. They are all now busily employed in dressing exact order.

OBSERVATIONS ON THE NATURE AND PROPERTIES OF THE YELLOW TURNIP.

Drawn up at the request of the Right Honorable Sin JOHN SINCLAIR, Bart. by R. BARCLAY ALLAR-DICE, Esq. of Ury.

I certainly think, taking every thing into consideration, that the yellow turnip, when of the year, that they had double the keep of the comred sorts, when they came to the yellow, requirwill grow on inferior land, and with less manure and may be treated in the same manner as the common sorts of turnip. Indeed, I have got a proportion of Swedes, that were manured at the rate of thirty-five double cart loads per English acre, which is at the rate of from ten to fifteen but by this means would be made useful to the loads more than the yellow, yet the latter is very superior. They have not that hardiness, also, which the Swedes possess, which is so injurious those papers will be found useful; but three feet to young stock and to sheep. The proper sort, intervals, as mentioned there, are too wide; allikewise, will stand the winter equally well.-Cows fed on yellow turnips, give milk and butter, equal in quality and flavour, to the middle of mould in those wide intervals, and in rainy weamiddling districts of Scotland, is from the 10th to the 20th of June.

In cultivating turnips, I found the Revolving Harrow of the greatest service. I grew them in one field of twenty acres, which got one deep ploughing before winter, after oats. It was never touched again till the middle of May, when the whole culture, previous to the drilling, the the whole culture, previous to the drilling, the supply of mould for their support. Your very vadunging, and sowing, was done by the Revolving luable correspondent, Mr. Curwen, I should think, Harrow. I have just drawn a third part of the might grow this plant to advantage for soiling; but in preference to any thing I have yet seen for the plan recommended by Mr. Blaikie. By a fair trial last year, I found they would keep, much greater weight of valuable food may be obwhen placed, from November till the middle of May; and that tops and all, they were as good and fresh as the day they were drawn. I showed nips, they will continue good all the summer, if them in May last to several farmers, who cut laid undry in pies, the same as potatoes general-them open, and convinced themselves of the great ly are. I am, Sir, your's respectfully, superiority of Mr. Blaikie's plan, over every other, for preserving turnips. It is now getting into very general use in this neighbourhood. Ury, Nov. 5th, 1821.

We suppose this to be the Scotch yellow turnip, sent to R. Caton, Esq. by Mr. Coke, and distributed amongst some of our subscribers.—Peter Minor, Esq. of Virginia, speaks highly of it. Edit. Am. Farmer.

APPLICATION OF THE HOLKHAN MA-NUFACTURE.

> North Creak, Burnham, Norfolk Nov. 30, 1821.

SIR .- As I was riding through Holkham, a short time since, my eye was caught by a number of poor people passing to and from the Hall: on inquiring the occasion, was informed that Miss Coke had been giving her annual denation. poor had received one hundred large good blank-ets, with a great many sheets and bed coverlids, to keep them warm the approaching winter.— They spoke of the sheets with unusual pleasure, stating, that they were dressed and spun by themselves from the flax grown in the Park last year: they appeared grateful, and said that they had been now doubly paid, first for dressing and spinning them, and now receiving them as a free and spinning the flax grown in the Park this year. Their benefactress is indefatigable in her attention to them, observing St. Paul's directions to the Hebrews, " To do good and to distribute forget not, for with such sacrifices God is well pleased." I did hope to have seen more of the neighbouring gentry following such a laudable example, and setting their poor deserted neighbours to work; but I fear they don't observe what St. John says on brotherly love to one another: "Whoso hath this world's goods and seeth firefier sort, is the best kind of any. I proved last his brother have need, and shutteth up his bowels of compassion from him, how dwelleth the mon turnips; for the same number of sheep that love of God in him?" The poor are willing to required shifting twice a week on the globe and work if employment is found for them. Something must be done for them, and that immediateed only being shifted once a week. They have ly, for it is now out of the power of the farmers to also many advantages over the Swedes. They support them.

You would gratify your readers, Sir, if you will select such things as you think worthy their no-tice from the Bath Agricultural papers, they bevaluable information lies in obscurity in them, public. The culture of lucerne is not generally so well known as it ought : your quotations from intervals, as mentioned there, are too wide; although a great weight may be obtained, the outside plants in the rows fall down on the fresh summer. The best time for sowing them in the ther get so full of grit, that the stock will not eat it. The best plan that I have found to answer, is to drill at twelve inch intervals; to hoe and weed the plants, keeping them clean the first two years. If the ground is very good, and the plants very vigorous, every other row may be taken up, and the crop will then do well, as the intervals may be ploughed, and the plants receive a fresh tained per acre with them than from any thing we grow; and they have this advantage over tur-

THOS. HEROD.

From recent information it appears, that lucerne will not succeed on heavy land, and consequently would not do well with Mr. Curwen. The mangel wurtzel is very valuable, and we learn that crease the number of hours for them to rest .the yellow sort is by much the more fattening, although it does not give so large a crop.

Edit. Farm. Journal.

ON TARES.

Bedfordshire, Dec. 1, 1821. SIR,-In the late Farmers' Journals we have

been reading much concerning tares. They are estimable upon heavy soils, whether used as green food, or eaten off by sheep, or preserved for seed, for which latter purpose they have often paid as well as a wheat crop. We also consider that there is no better preparation for whatever corn may follow, particularly for wheat: upon the authority of some of the best Norfolk farmers, we must however conclude, that their culture is less applicable to light sandy soils. It surprises us, that a question should have arisen, whether there be a real distinction between summer and winter tares. It may perhaps not be possible to discriminate the seed of the one from that of the other; but when they get into leaf, the winter tare is of a deeper duller green, and is less luxuriant. The leading difference, however, is, that the winter tare never suffers from the severest frost, if it have once well taken root: while the other is sure to die in any but the mildest winters. A neighbour of mine happened not to have seed enough for the whole of a field destined for winter tares: he obtained some seed to finish with, from a distance: at first the more rapid growth and lively green of the latter appeared flattering; but they proved to be summer tares, and all perished in the winter, while the others were unaffected. The winter tares cannot be put in too soon after harvest; the others should be sown at intervals, from March to June : both are fittest for mowing green, and most healthy for cows and horses when the blossom drops off, and the pod begins to form.

As it is right to try every-thing, I drilled last spring three acres of Heligoland beans. All my other beans, about forty acres, inclusive of some in the same field with the above three acres, turned out everything I could wish; but so miserable ing too voluminous to meet the public eye; much a crop as the Heligolands never was seen on my farm. There was no fullness of fruit to compensate for the shortness of the straw; and as always happens where there is failure, weeds usurped the space that should have been occupied or shaded by the beans, with probable injury even to the wheat in the succeeding season. I expect to have to encounter a contrariety of opinion; but never again will I be induced to try this puny

abortion of a bean. Your's, &c.

BEDS.

DISTILLERIES.

(From Mr. MIDDLETON'S Survey of Middlesex, published in 1807.)

Under the above head are the following obser-vations on the value of the grains and wash (that is, the refuse of the corn distilled,) by which it will appear that but little of the food of man is deducted from the corn. The quantity per annum is estimated at 500,000 quarters. The distillers fatten annually 50,000 hogs for bacon, increasing the value of them £4 each or £200,000. Also, the wash probably increases milk and beef in London, besides paying for all the hay and other things eaten with it, to the annual amount of

" It redounds much to the credit of Mr. Man, of Bromley, in this county, who about the year 1789 began to give distillers' wash for the fattening neat cattle, which so evidently improved them, that he soon tried mixing other food with the wash, in order to induce the cattle to eat more in quantity, to consume it in less time, and to in-This succeeded in so extraordinary a manner, that he has extended his buildings, and increased the number of his bullocks, so as to be able to feed nearly that number in his stalls. I understand he quince, and the hear is greatly improved, by becan in this manner fatten between four and five ing put on the apple. This I was told, was practious and oxen and cows annually. At this time tised at Belle Air, the seat of Benjamin Ogle, (1803,) he cuts into lengths of an inch and an half, or two inches, at the expence of two guineas, there is always a large knot found, at the junction which for the desired and the feel of each and large knot found, at the junction with the feel of each and large knot found, at the junction with the wood in the feel of each and large knot found, at the junction with the wood in the feel of each and large knot found, at the junction with the wood in the feel of each and large knot found, at the junction with the wood in the feel of each and large knot found, at the junction with the wood in the feel of the April, with great success.

To the honorable the Senate and House of Representatives of the United States in Congress assembled.

THE MEMORIAL

Manufactures, respectfully sheweth-

That we hope to make it appear, there are so more unequal than the above. many radical defects in the existing tariff, as to order to reconcile it to sound policy and equal justice.

Our objections to it are principally of two kinds :-

I. That in this country of equal rights and equal freedom, it is marked by one feature, condemned by the unanimous voice of all wise statesmen, and by every principle of justice and policy, viz. it bears with enormous weight on the poorer classes of society, by exorbiant duties on necessaries of life, all of them universally, and some exclusively, used by those classes; whereas a great variety of articles, partly of luxury and partly of convenience, used exclusively by the middle and wealthy classes, are admitted at very low rates.

II. That notwithstanding the clamor raised against protecting duties on manufactures, as munity, to pass on it such decision as it may be taxing the many for the benefit of the few," the found to deserve. manufacturers have far less protection than the agriculturists. Whereas manufactures being generally of small bulk in proportion to their value -being therefore subject to light freights-and most of the very important ones being fabricated by machinery, of which the powers of production are almost boundless, they stand much more in need of governmental protection than the fruits of the earth, the great bulk and limited production of which present a bar against such enormous importations, as have taken place with respect to manufactures.

On the first point, we respectfully represent,

The price of Muscovado sugar, at the Havana, January 20, 1822, was \$3 per 104lbs. The duty, 3 cents per lb. is about

The Bohea tea imported into Philadelphia November, 1820, cost 10 and 11 cents per lb. The duty is 12 cents, which on the inferior kind, is

On the superior, The duty on East India coffee is from Salt at Liverpool, on the 2d of January 1822, cost 20 shillings sterling per ton, or about 11 cents per bushel. The du-

ty is 20 cents, and therefore is equal to Molasses at the Havana on the 20th of January 1822, cost 16 cents per gallon.

The duty is 5 cents, equal to It forms a most striking and revolting con-trast to the above, that silks, satins, bombazines, bombazets, linens, and cambrics, pay only a specific duty of

Superfine broad cloth, cashmere and merino shawls, chintzes, carpets and carpeting, pay

Thus it appears that-\$100 worth of Bohea tea, Pays \$120 duty which is only the 66 do. of salt of Musco. sugar, 120 do. 380 do. of molasses, same amo'nt

do. of coffee, as is paid by \$480 worth of superfine broad cloths, 260 cashmere and merino shawls, chintzes and carpets.

\$600 of superb cutlery, china, girandoles, chandeliers, &c.

\$800 worth of silks, satins, bombazets, cambrics, linens, &c. &c.

We respectfully state, that we are pursuaded Of the Board of Manufactures of the Pennsylva- there is not, and never was, in the world, even unnia Society for the encouragement of American der the most despotic governments, or in the ture, it will excite universal astonishment, that most uncivilized nations, a system of revenue

On the second point, we observe, that we have imperiously require a revision and correction, in been greatly concerned to find, during the intense distress and excessive ruin, which for years past spread among the manufacturers, whereby hundreds of capitalists, among whom were to be found many of our most valuable citizens, with large, and estimable families, were ruinedthousands of workmen bereft of employmentand millions of capital wholly sacrificed; that many of the farmers and planters arrayed themselves in opposition to the application of the sufferers for relief by an increase of duties, although the duties on all those articles interfering with the interests of agriculture, which are usually imported, are higher, and some of them twice as high as those imposed on manufactures. On this point we make no comment. We submit the facts to the consideration of an enlightened comfound to deserve.

Muscovado sugar, as already stated, pays a duty per cent. 100 Duty equivalent to Hemp is subject to a duty of 30 dollars

per ton, which is equal to Cotton pays three cents per pound, 33 to 40 equal to

Cheese pays nine cents per pound, equal to On English, 40 to 50 Dutch,

To secure a market for the distillation of the grain and fruits of the farmers, and for their each brandy, rye whiskey, &c. there are exorbiant duties imposed on foreign spirits-

On West India Rum 110 per cent. 140 Gin. Bordeaux Brandy, 90

The entire consumption of the United States her cent. 100 from the establishment of the government to the present time, with a very trifling exception, has been secured to the tobacco planters, by very high duties on snuff and manufactured tobacco, 120 about 80, 90, or 100 per cent.

the soil. Far from it. The system has our most at thirty three per cent, and the last at twenty-decided approbation. Our object is to place the five; and that the alledged danger of encourfatherly and fostering care bestowed on agri- aging smuggling, by the adoption of that tariff, 31 culture, in contrast with the exposed situation of cannot be supported as an adequate reason for its manufactures.

ble bodies the above statement of the duties imher cent. 15 posed obviously for the protection of agriculture, monopoly, the consequence assumed from raising

we respectfully request your most serious atten tion to the inadequate protection afforded by du ties to manufactures.

Linen, and all other manufactures of flax, are subject to per cent. 15

Hempen cloth, (except Russia and German linens, Russia and Holland duck,) cutlery, all kinds of hardware not enumerated, anvils, fire-arms, stone ware, pottery, earthenware, all manufactures of iron, steel, brass, lead, and tin, are subject to

fanufactures of cotton and wool, (except those of the former below twenty-five cents per square yard,) are subject to Leather, manufactures of leather and of wood, hats, caps, and a few very unim-

portant articles, are subject to We confidently hope, that when this fair exhibit of the duties on manufactures is compared with those imposed for the protection of agriculan idea should have ever obtained belief, which is diametrically opposite to truth, that manufactures were exclusively protected-and that agriculture neither had nor required protection.

As this is a point of considerable importance, we wish to throw further light on it, and display more fully the inequality of the advantages enjoyed by the two classes of society.

The duty on Musher cent. The duty on linens or cambrics covado sugar, we 1.5 have seen, is Freight, and other equal to 100 charges, about 5 Boxes, freight, &c. 50 20 Duty on broadcloths, chintzes, 8cc. 25 Freight, &c. 5 30 on cotton Duty on cotton and wool, averages thread stockings, 36 10 Freight, &c. flax, oznaburgs, Brown Hollands, 46 &cc. Freight, and other charges Duty on hemp oz Duty on hemp Expenses 27 naburgs 20 Expenses 6

We might pursue the contrast to a great extent-but we believe this is abundantly sufficient.

44

We further respectfully represent to your honourable bodies, that the highest ad valorem duty In order to guard against misconception, we proposed by Mr. Baldwin's tariff, was only forty wish most unequivocally not to be understood as per cent.; that very few articles were subject to disapproving of those or any other duties for the this duty; that manufactures of cotton, wool and protection of our fellow citizens, engaged in the iron, which comprise three fourths of our imuseful and honourable employment of cultivating ports, were proposed to be dutied, the two first rejection, while so many articles are subject to After presenting to the view of your honoura- duties 50, 60, 70, 80, 100, and 200 per cent. higher.

That the alarm of the danger of extortion from

the duties as proposed in that tariff, is equally incapable of being maintained; as this point has
been fairly tested and set to rest for ever, in the
case of coarse cottons, which are subject to duties averaging 50 to 85 per cent. and actually prothe national resources, suffer with them.

That past experience forbids us to place dethe national resources, suffer with them.

That past experience on a continuance of the present intheory.

the manufacturers, during the late war which was citizens of a chance of sale, and of that reward to the principal reason for the reduction of the rates which industry has an indefeasible claim.—
of duties proposed by Mr. Dallas's tariff, was "Goods," to use a favorite phrase, "were imported the premises into your serious ted cheaper than they could be manufactured at home." Ruin spread among our manufacturers.
Thousands of the working classes of society, male and the extraordinary rise in the price of the means of supporting themselves and their fruits of the earth, wheat, cotton, and tobacco, which have been often advanced forty. fifty, and perism; and exposed to the lures of vice and claim.

Tour memorialists, therefore, respectfully pray you would take the premises into your serious consideration, and adopt such measures as you may judge adapted to promote the wealth, power, and resources of the United States, and give them that stand among the nations of the earth to which the transcendent advantages they enjoy, natural, moral, and physical, give them so fair a which have been often advanced forty. fifty, and perism; and exposed to the lures of vice and the manufacturers, during the late war which was citizens of a chance of sale, and of that reward to to that bestowed on commerce and agriculture. which have been often advanced forty, fifty, and perism; and exposed to the lures of vice and one hundred per cent. in the course of one, two crime. ON THE CULTIVATION OF TARES.

Holly Hill, near Titchfield, Hants, Oct. 31, 1821.

SIR,

Observing in the Farmer's Journal of Oct. 29, an answer to the inquiries of a correspondent on the mode of raising and using Tares, I send you the following remarks, which may perhaps afford some useful hints to those of your readers who are not in the habit of introducing this valuable plant in-to their rotation of crops. The spring and winter tare are of a distinct species; the latter comes into blossom soonest, and bears the severest weather uninjured, whereas the former will not stand the cold of winter. On a farm of 300 acres (whereof two thirds are in tillage,) I sow annually about 30 acres on part of my wheat stubbles, or after my early potatoes, and I find them of great benefit to any sort of stock that I kee . My plan is to break up the stubbles as soon as possible after harvest, and to put in the tares with one ploughing, either drilling them, or sowing broadcast, after an implement called a presser, which throws the land into ridges, and causes the grain to fall into the regular furrows prepared for it. I tober. I use about two bushels of seed to the acre, and sometimes mix a little light wheat with whilst growing. The sowing of the spring crop commences in February, and may be continued, to May or June, by which means a constant succession of excellent green food will be provided. I seed off as many acres of tares as possible with my sheep (commencing as soon as the first flower shews itself,) and reserve the rest for my horses, my milch cows, (which are soiled in a yard all the year,) and my pigs. For the latter animals and for horses, they are a most nutritious food in the autumn, when they are podded and full of seed. On the land where the tares have been fed off, I immediately put in drilled turnips (without any other manure than what the sheep have dropped,) or transplanted Swedes, or transplanted mangel wurtzel. It is also very good husbandry to put in a crop of spring tares after the winter ones, on the land intended for wheat.— Where the clover has been killed during the winter, spring tares may be put in about Februathe winter, and put in a crop of carrots instead, in March or April. I did not plough the land for spring tares after the clover; I only scarified it once, and immediately drilled in the seed. The scarifier and drill are the same implement, only altered a little for their different operations; they each work at the rate of six acres per day, the former with four, and the latter with two horses and perform extremely well. I had therefore very little expense in tillage and sowing. A field of five acres, which in September, 1820, I sowed with winter tares, was forward enough, in the spring of this year, to receive my ewes and lambs on the 27th of April. I passed the flock P. S. The above calculations are s rapidly over the first time, and did not eat them be correct, subject to a small fraction.

days; and 235 ewes, 206 lambs, and 28 dry ewes, eight days; and afterwards, at the second feed-ing, which began on the 20th of June, they supported 458 sheep one day, 637 sheep four days, and 186 sheep one day. On that field I have now were put in as soon as the tares were finished. On the whole, I consider tares as one of the most profitable of the green summer crops; and I hope that the statements I have given above will convince other persons of their great utility.

I remain your obedient servant,

VARRO.

IF We shall be happy at all times to hear from this correspondent .- Edit. Farm. Jour.

TO GRASS FARMERS.

Hants, Nov. 1, 1821.

Being partial to sheep stock preferably to that of larger cattle, a considerable part of my lands being rather in a strong soil, and subject to poach in winter, and in moist seasons, some difficulties of the relative consumption of stock, which I it, which I find of use in supporting the tares hair. Supposing the grass or green produce to cond time, which not only very much deteriorates while grass or green produce to the soil, but in some instances as was the grass down to grass, I fear it is impossible to render the stock productive to any beneficial amount, should the above calculations prove tolerably correct, and the reasonings deduced from them valid. The opinions of some of your numerous and intelligent correspondents on the subject will latter part of the year.

In my next, you may expect a more accurate view of the state of the crops in Scotland; and reatly oblige, Sir, your very obedient servant,

A. B.

ON SOWING TURNIPS EARLY FOR SOILING.

Edinburgh, Oct. 24, 1821.

SIR, The result of an experiment made by that inand 186 sheep one day. On that field I have now defatigable and enlightened agriculturist, J. C. an excellent crop of transplanted Swedes, which Curwen, Esq. M. P., Workington, deserves to be made known to the whole of the farming world. The great difficulties which Mr. Curwen had experienced in the soiling of his cattle during the latter part of the season, determined him to sow his turnips much earlier than on any former occasion, for the purpose of supplying the deficiency of green food during the latter part of August, September, &c. With this view, he sowed the yellow, white, and green turnips, during the two first weeks in May, and his crop is, without exception, not only the best in his own neighbourhood, but is not surpassed in any part, either of the north of England or of Scotland. On the 18th of August his turnips weighed 221 tons; and on the 30th of August they were 30 tons on superior soil, and raised with manure; and on the 2d September they weighed 32 tons. On the 10th September, his turnips raised with bones, sown a week later than the former, weighed 221 tons, have arisen in my mind, formed upon calculations and those raised with a kind of manure from London, 20 tons, 16 stones, whilst the common wish to submit to some of your best informed cor- town ashes produced a crop of 27 tons. On the respondents, who may possibly solve my doubts 28th September they weighed 36 tons; and on begin to sow in September, and continue to do so, on the subject. It must be an exceedingly protect the 7th October, the green globe weighed uptathe intervals of a fortnight, till the end of October. I use about two bushels of seed to the produce one ton and a half of hay and a ton or from this system is, that those who soil are not unrowen or aftermath, in the whole two tons and a der the necessity of cutting their clover crops a sehave sunk one third in weight upon being dried the soil, but in some instances, as was the case and made into hay, the whole green produce frequently this season, it hardly repays the exwould be within a fraction of 7332 lbs. Now, sup- pense of cutting. It is very possible, in good seaposing every sheep of the middling average size to consume 6 lbs. of green produce daily, and that would appear a very scanty allowance, each sheep would consume 2190 lbs. of that produce—less than 3½ sheep throughout the year upon the very best meadow. Now, suppose the average of a grass farm produces one moiety of the best meadow, and that is rather a large average calculation, then a moiety of that stock would suffice for the consumption of the whole, or 1½ sheep per acre. Supposing again the average produce of a sheep to be 15s, which I consider as a large allowance, and certainly rather more than the actual profit, the whole amount per annum would be £1. 6s. 3d.; this would be the whole gross proposing every sheep of the middling average size to sons, to have the turnips ready for drawing in the be £1. 6s. 3d.; this would be the whole gross produce. Deduct from which, interest of capital, tithes, poor-rates, expense of shepherds, accimited great advantage derived from turnips, and their tithes, poor-rates, expense of shepherds, accimited great advantage derived from turnips, and their duce. Deduct from which, interest of capital, since if clover be given in a succulent state to mitch cowe the given in a succulent state to ry with great advantage. I this year sowed in that month about 15 acres of spring tares on land where the clover had perished, and on the produce I kept 650 sheep 20 days, besides supporting 10 horses during the same time; 7 milch cows 14 days, and about 100 store pigs two months. About twelve acres of the land were cleared of the tares in time for turnips, which are now a good crop. These I could have off in time for sowings wheat this year, but I shall let them stand through the winter, and put in a crop of carrots instead. ferably to all others as considering it the most pro-table. In a mixed farm, consisting partly of the deficiency of six weeks with clover, vetches, arable and partly of meadow and pasture, aided &c. It ought also to be remembered, that the by sufficient crops of turnips, sheep may not only be useful but necessary: but in a farm wholly laid down to grass, I fear it is impossible to render

view of the state of the crops in Scotland; and

^{*} Our correspondent probably meant to alla a P. S. The above calculations are supposed to week, which is about a hundred weight per diem to each .- Edit. Farm. Jour.

IF We have the pleasure of adding to the above, an extract of a letter recently received from Mr. Curwen, wherein he says, "I this year sowed my white globe, and the yellow turnips, the first week in May, and began to pull them the 20th of August, weighing then 24 tons, and be-fore the end of the month 27 to 30 ditto. By these means I can feed more than nine months on turremoved." In another paragraph he says,—"If straw and turnips will not fatten cattle, there is years-old steers to 80 stone of carcass (14 lbs.)—period of ter death. salt; this keeps them in good health of body, and I never give them corn, cake, or hay." It would informed, what may be the expense per head in fuel and labour .- Edit. Form. Jour.

ON THE RED WATER.

Kelmarsh, Qct. 30, 1821. Sin,-Observing in your Journal of yesterday the Query of Rusticus, I beg to refer him to that truly valuable work, entitled "Every Man his own Cattle Doctor," by Mr. Clater; he will there find the disorder, called Red Water, concisely, but clearly and satisfactorily explained, together with the cure, or rather, perhaps, I the use of those who may not like to purchase the work, of the efficacy of which I can speak with confidence, after repeated trials. Take Epsom salts six ounces, nitre in powder four ounces, boiling water three pints, which pour upon the salts. When new milk warm, add spirits of turpentine four ounces, bole armoniac in powder half an ounce; mix well, the dose from three to four table spoonsful, and the above about suffi-cient for 30 sheep. Mr. Clater recommends that the sheep be fasted two hours before and after the drink is given; and in order to perform the business expeditiously, if several require the medicine, a small horn should be provided, holding the proper quantity. I have sustained some loss this year, as I suppose, through the luxuri-ance of the Swedish turnip tops, though changing from superior to good grass keeping will often cause the disorder, which for the most part attacks the best sheep, not one, however, out of

WM. THORPE.

We thank this gentleman for the ready (bole armoniac) in the foregoing recipe.

stantly stirred.

bloody urine, and the reply of Mr. Thorpe shews, of great increase. Those which form almost imthat this is the case at present : the name is cer- mediately from the stem, are improper, as they tainly a very proper one, although this disease, is occupy too little space in the ground, and mutucalled the resp in the fens and marshes, and ally prevent each others' growth.

another disease, of which sheep die more suddenly, though not in such numbers, nor on the same sort of keeping, is called the Red Water.—

will strike the minds of the readers through a This latter is probably the same which the Scotch different medium to a verbal communication, and me, respecting your cylinder straw cutter: I

will be well for us to adopt the Scotch name for prejudice against the planting of whole potatoes, this sort of mortal sickness. We should be hap-trom fear of a great quantity of seed being nepy to learn from any experienced correspondent in cessary.

Scotland, what are the symptoms? What the season? What the keeping and other circumstances (as the age of the sheep, &c.) of, at, and on which sheep die of the braxey? We find by the explanation of Hogg (the Ettrick shepherd,) that there are several species of this disease, or what is more likely, several diseases called by this soiling, in April and September, is by these means removed." In another paragraph he says,—"If little profit to be expected. I have for some distemper, but by the symptoms it is the bloody been highly concentrated by intense heats. Unyears reared and fed my stock in sheds on green urine, only attended with some peculiarities of equivocal signs of putridity are manifest in the carfood, and I find no difficulty in bringing my three- appearance, owing to the different state of body, casses of animals that die of the Quarter Evil;

length into this subject, with a view to divide and thence to the lungs. As the progress of malady be a great pleasure and satisfaction to us to be distinguish the diseases of sheep which cause is so rapid, whenever it appears, all the cattle, speedy or sudden death, because no subject re-except milk cows, should be bled, and medicine lating to stock is so much neglected, or so little understood .- Edit. Farmer's Jour.

> ON PLANTING POTATOES. Gargreave, Kirkby, Lancashire, } October 15, 1821.

From some little knowledge which I possess of skin, which like a dry hide, rattles if we attempt the physiology of the plant Solamum Tuberosum to handle it. All the cattle should be minutely or common Potato, as well as from frequently examined, in case they require friction with a reading accounts of the superior productiveness hard brush, to remove this symptom. After rubshould say, the prevention of this destructive from whole potatoes, induced me, this season, bing, let them be driven into the sea, or into a malady. I shall however, subjoin the recipe for the use of those who may not like to purchase a two-acre field of 158 yards in length, at one about ten minutes or a quarter of an hour, give yard between and 15 inches in the row, with large them quick motion on land; and it is hardly whole ones; and getting them up myself a few needful to suggest, that the quantity of friction, days ago, the produce was 20 bushels, 75 pounds exercise, and medicine, must be according to the to the bushel, which is equal to 408 bushels and age and vigor of each animal. Our prescription a half per statute acre. I also took up three rows, is adapted for calves three months old; and no planted at the same time with sets, at 27 inches remedy should be used for an hour at least be-between and ten in the row, which produced 22 fore and after the calf has had milk, either from bushels and one third, nearly 305 to the acre.— a dish, or by suction from the mother. Indeed, The potatoes, were subsequently treated alike, it is indispensable so to divide the time for with the exception of raking in the dung, in the each application, that regular intervals of rest first case, into the furrows on each side of the may be allowed; and such prescription must be potatoes, though no more was originally spread up-on the ground; but it was long and could not be well or chilly days of a milder season, it would be imturned down otherwise. The method of planting proper to give a cold bath, therefore the cattle potatoes in the northern part of this county, must have more exercise on land. The drink for the chief food of the labouring classes, is to put barley meal; and for medicine, an English pint them into furrows, raking in the dung, and coor warm water, whitened with barley meal, is to vering them with the succeeding furrow upon a be employed to dissolve two tea spoonfulls of sales. flat surface, planting in every third furrow, and 240, has died since I gave the drink. During the flat surface, planting in every third furrow, and petre grossly powdered; to which add a winenot in the ridge or turnip system. The first glass full of a strong infusion prepared from method I consider better, unless upon heavy, retentive soils, imperfectly under-drained, as the common harrow, on the first appearance of the plants, will more effectually extirpate the weeds before the boiling water is poured over them. and a greater quantity of fresh mould may be Immediately before the dose is administered, answer to the Querist, and are happy to find, by brought up to the stems; two very important mix with it two tea spoonfulls of vinegar; put his description of the disease, that he is accurate in his notion of its identity; no benefit, howofile, should sedulously enough the calf. If herbs, or juniper berries, for the rate in his notion of its identity; no benefit, how-observations to the public, should sedulously en-of the calf. If herbs, or juniper berries, for the deavor not to deceive; and upon that principle, infusion, cannot be speedily procured, two ounces I have to observe, that those potatoes which elon-We learn by perusing Ellis's Gentlemen and gate their bulb fibres to a distance from the root, and barley meal, will supply the place of these, shepherd's Guide, that Red Water was the name are the best to plant whole, which are characterthen generally given to the disease attended with istic generally of those with white flowers, and

some remarks on Mr. Curwen's plan of im- call the braxey, and if this can be ascertained, it in some measure, perhaps assist to dissipate the proving wastes. Your's, &c. F. SIBSON. will be well for us to adopt the Scotch name for prejudice against the planting of whole retained.

ROGER POSTLETHWAITE.

ON THE QUARTER EVIL. SIR.

The Quarter Evil generally appears after a called the yellow sickness, he mentions as a rare distemper, if the juices in their pastures have period of continuance, or time of examination af- but one quarter is peculiarly affected, and if the disease lodges in a fore quarter, the danger is It has long been our intention to enter at some greatest, because the neck is tainted, and from given by way of antidote. The instrument employed in bleeding must be specially cleaned with warm water, and dried between each operation, since the least tincture of blood from a diseased subject would convey putrescency to a sound animal. One of the most decided indications of the Quarter Evil, is a tension of the where large quantities are annually grown, being cattle in hot weather should be whitened with wormwood, or rue, sage, angelica, or juniper berries. As juniper berries contain much camphor, of the best gunpowder, mixed with warm water

from

r: I

SIR-I am so well pleased with the operation of the cylinder straw cutter (for chaffing all kind of long forage,) purchased of you last November, for the use of Orange Farm, near this city, belonging to Robert Smith, esq. that I now transmit to you the result of my experiments. Previous to the purchase of your machine, Mr. Smith requested me to send for two machines, (say Eastman's patent, and Barnard's Patent,) and make a fair trial, and the one that answered the best purpose, he would purchase for the use of the farm, as he was determined to have every description of long forage chaffed. The two machines were procured, and brought to the farm on the same day. Barnard's patent had a fair trial but would not answer the purpose at all; but whether owing to the principle of the machine, or bad workmanship, I will not pretend to say. Yours, (Eastman's Patent) had also a fair trial and really surpassed my expectations, and has been in operation ever since, (upwards of two months) cutting all the long forage of every kind, that has been fed to upwards of seventy head of stock; during this time the knives have been taken off but once, and then ground on the farm, and reset to the machine. Two hands with this machine, will readily cut from sixty to seventy bushels per hour. I have no hesitation in saying, it is far superior to any machine I have ever seen. during this time the knives have been taken off it is far superior to any machine I have ever seen that the better course will be to select for our for the same purpose; and it is my decided opi-

is saved by cutting and steaming it.

Respectfully yours,

N. UNDERWOOD,

Manager for R. Smith, Esq. at Orange Farm. February 7th, 1822.

AME, OC ALDERNEY CATTLE.

Hampton, June 1st, 1819. Miss Eve Igau requests to inform you that she had the cream from the English (Alderney) Cow, from Friday evening last, churned to-day, (3 days) from which she had 34 lbs. butter, and also the cream from two of the others picked out for the best INDIAN CORN AND NUTMEG SEED-from EDmilch cows, churned, which produced 41 lbs.; they were all in the same pasture, and milked in the sheep pens, for the same length of time.

I am, Sir, respectfully, Your very obedient servant, JOHN HENRY.

GENL. RIDGELY.

Hampton, to the hospitable proprietor of that cow and two of his best cows. It will be observed

should have written to you sooner, but wished richness of the milk of an Alderney and that o to be perfectly satisfied, that the machine would two other cows, considered the best in a here which fits it exclusively for the pail-or rather support—the lactescent secretions predominate over all others, and the extraordinary richness of no person I think who wants a straw cutter, will purchase any but yours.

I am Your's,

THOMAS IS: would be avoided by a stranger purchasing milch cows, by the eye, and for the shambles or the yoke, are not to be recommended.

Edit. Am. Farm.

THE FARMER.

BALTIMORE, FRIDAY, MAY 3, 1822.

IT In publishing discussions on the great question of governmental protection to Domestic Industry, some rule must be laid down, lest in the interest excited by the importance of the subject, and the very opposite opinions enter-tained upon it, we should be called upon to appropriate to the discussion, a greater proportion of this journal than could be yielded to it, having a just regard to other topicks. It is already known that our first wish is to communicate the experience of the sun-browned practical Farmer, in preference to the fine spun lucubrations of the Philosopher, or the calculations, however profound, of the political economist. Yet it cannot be disputed, and we must not forget, that the plough works most efficiently when industry takes the handles and scireaders, the expositions made by them, without nion, that at least one half of all kinds of forage, admitting in reply the essays of anonymous is saved by cutting and steaming it. vidual appear, under his proper name, let him be answered in the same way; but we should prefer, now that societies are organised to concentrate and express the opinions and views of these interests respectively; that our readers would feel satisfied with the representations emanating from them. If we have taken a wrong view of the subject we are open to contour. -0-

AGRICULTURE.

MR. GARNETT'S ADDRESS.

[CONCLUDED.]

made ten barrels and one bushel, and the culture Whilst we are on the subject of economizing, in both cases was as nearly alike as practicable; I will take this occasion to suggest, that a very

tion of the seed; by preparing the surface better To tell them that the best mode often of econo-

team with low slides, drawn either by single and conceit themselves in the high road to agrihorses, mules, or oxen, which slides can take cultural wealth and distinction. Not that I would their loads without requiring (as in the cart and by any means check the wish to make what we many, whether wheat sowed in corn land with us, sense, can make them; and the only cost, except war itself, that dreadful scourge, and greatest disdoes not make full as much per acre, as it will the labour, is a few nails. Lastly, the common grace of human nature, would forever disappear from a naked fallow. In defence of our 3 shift method of separating the grain from the straw, from the fair face of creation. method, I will state the following facts, both ge-neral and particular, from my own experience: recommend it, but is in all respects the most The second is, that an acre of corn, (the best in fanning, which may be executed by the same sixty bushels. The same acre, three years ago, trodden wheat always needs two fannings, and produced only ten barrels and one bushel. All sometimes three, all performed by hand. Mathat has been done to this acre for improvement, chined wheat commands a better price at markwas to roll in plaster the wheat which was last et, will make better flour, and the offal is inseason sown upon it, and last spring to sow one comparably more valuable. Yet such is the inbushel of plaster on it, as it was ploughed up for veteracy of habit—the more inveterate always,

wagon fashion) one hand to stand on the top of want, instead of purchasing, if the saving is real, With respect to wheat, there are many methods not generally practised, by which a considerable saving of time and expense might be effected. And first, as it regards seeding. We merely although the table seeding want, instead of purchasing, if the saving is real, want, instead of purchasing, if the saving is real, the grain, and another on the wheel, in order to not merely apparent. But whenever this self take it from a third, who has his station on the supplying fancy seizes us, we should take care ground, will draw the whole crop together in never tolorget, that the cost of the self-instructing fected. And first, as it regards seeding. We needly half the time consumed by the usual scheme, in regard to the making of agricultural simple, three-shift farmers, consider it a very mode. These slides are nothing more than two implements, is precisely the difference between important saving to sow our wheat in corn land; long poles, connected by a platform of boards of the work of cobblers, and that of master-workthe previous culture of which last crop, effects thin plank, in front of which are two uprights fixed men—added to the time lost both in making and such a complete preparation of the soil, that a in an auger-hole, or mortice, at the two upper using tools of inferior quality. It would be well single ploughing with small ploughs, and one corners, to the other end of which uprights a also to remember, that unless we buy of others harrowing, if the corn is all cut off, accomplishes small rope is attached. This rope, after the such articles as they make, and we want, they the whole seeding process, without a hand-hoe, slide receives its load, placed crosswise with the cannot purchase of us such things as we make, except among stumps, and in very grassy spots. heads in the centre, is passed over it, and hooked and they want. "To live and let live," is a max-I am aware that I am now treading on very de- in two notches made in the other uprights, which im of universal application; and if properly inlam aware that I am now treading on very de-bateable and debated grounds; and I am not without apprehensions, that a whole host of fal-lowists, and your 5, 6, 7 and 8-shift farmers may assail the above opinion, which is totally deficient in complication to recommend it. But be it known to all whom it may concern, that I speak the slides return to the field. The front end of maxim in fact, contains within itself the essence only of our Rappahannock country on tide-water, the poles are long enough for a horse or mule to of universal justice. Once establish it, as the where naked summer fallows have been found not be geared before the platform, and the other ends rule of conduct for nations, as well as individuals, to compensate the farmer for the additional labor extend about the same distance behind. Any and not only would contention, slander, cheating, of preparation; and indeed it is a doubt with common crop-hand, with three grains of common extortion, and theft, cease in private life, but

I will conclude these observations, relative to The first is, that my fields, cultivated in 3 shifts, wasteful, slovenly, and expensive that could be but grazed only by sheep, have obviously improved devised. To use machines, which are now so devised as to cost very little, saves all the time opinion, and in that of all who have noticed them, and labour of stacking; the grain requires but one open, level land, the latter process should be executed principally with the plough; the throwmy field) which I have just measured, produced horse-power that works the machine; whereas ing out the dirt, and trimming the sides, being the only operations which require other tools .-These last should be spades and ditching shovels, instead of hand hoes, which are most commonly used, and frequently so worn out, as not to hold more than a handful of dirt each. As to fencing, it seems to be a prevalent opinion, that corn. The seasons were nearly alike. In both, when we are conscious of its being wrong, that live fences should be preferred on every account treading with horses or mules and sometimes during the present summer, than when this acre even oxen, is still the prevailing method. Whilst we are on the subject of economizing, system of husbandry; which, but a little reflection will satisfy us, is not in all respects adapted and the distance 5½ feet by 18 inches, single stalk, general saving might be made in selecting the to our country. In regard to live hedges, for exAnother great saving in the seeding process is, best implements of every kind—for the best are ample, I think it in my power to prove, not only
to select the best and purest seed, and not to be always the cheapest in the end; instead of the that they are not the best and cheapest inclotoo sparing of it; for it is obvious, that unless you scandalous, make-shift tools, which are found on sures for general purposes with us, but in fact, give as much seed as your ground will bear, you far too many of our farms; some of them, indeed, the dearest and worst, except in a few particular must loose infinitely more in your crop, than you so little resembling the things for which they situations; and even then, that they are not enpossibly could have saved by sowing thin. Most are intended, that a stranger, accustomed to good titled to so great a preference, as has generally of us, I believe, have heretofore erred in this paragricultural implements, would be puzzled to been conceded to them. I can affirm, from my ticular; for experience has proved, that our lands guess what they were. There cannot be a greating energy, wherein we have formerly sown from er mistake in economy than this make-shift plan, without any ditch, the materials for which, grow three pecks to one bushel, will produce much bet- which is as irrational, as it is common. For even spontaneously over a large portion of our state, ter when the quantity of seed has been increased admitting that a half-tool will do half-work, there and will grow by planting, almost every where in from one bushel to one and an half per acre. is an irretrievable loss of time. But the fact is, our country, will last, without the slightest repair Thick wheat is also much safer from rust, than that it is a physical impossibility, for even half-thin. Another important advantage in seeding work to be executed in the same time, if at all, and may be made to last 6 or 8 years longer, by a may be gained, by levelling the ground, either by with an implement half worn out, or so illy made, few occasional supplies of rails and posts. But chopping with the hand-hoe, or harrowing, and as scarcely to answer half the purpose of a good this last fact need not be taken into the calcularolling much more than is common. Although one. Yet there are thousands, into whose heads tion, by those who think it too vague as to the there is some little additional labour at first, this you can never beat it, that economy means any quantum of repairs. I also know, from my own is amply compensated by the more equal distribution but the immediate, direct saving of money. experience, that either cedar, chesnut, or locust -(the last of which is still more durable than eifor grass seed, where you wish to sow them on mizing, is to lay out money, provided it be done then with it—one or two to each pannel. A few words now, never can be made to believe that they get their saving implement, said to be of great value, by "money's worth" in any thing that they purall who have ever tried it. The present mode of chase; and if they can only contrive, no matter and where there is any market for it, the price is collecting this crop by hand-rakes of the worst at what expense of time and labour, to cobble up possible construction, and drawing it together in ("within themselves," as they call it) some awkows a poor business. In the first of these cases, then, wasteful, tedious, and expensive. Half the usual and exult in their own functed ingenuity and thrift, should be calculated, but the cutting, preparing,

fence were not even hewed-the only labour bestowed on them being the cutting off at each end, and boring with a two inch anger, six holes to gard to the policy of adopting them, either as a cache and boring with a two inch anger, six holes to gard to the policy of adopting them, either as a cache and boring with a two inch anger, six holes to gard to the policy of adopting them, either as a cache and simply by cut-general, or partial system of inclosure. I have ed to be offered for Premiums, will gratify the This was the whole cost for 14 years; but the but these fences are manifestly the best of all, rules with those who contend for Premiums. fence would have been equally permanent, if when they can be made without the labour of disput up (as I have since tried) like a common tant transportation. worm-fence, and secured at each lock by two much nearer the truth. But we will assume a middle period, and say, that 11 years are necessary to complete a live-hidge. To say nothing of preparing the ground and planting—the hedge, during the whole period of its growth, will require land, either originally good, or made so by manure. It will require also, at least two annual manures are the least two annual manures are the least two annual manures. The plant or handshoe and will water the seasons. As the Deity alone can be required and planting and all the necessary Certificates of the growth of the growth of the received to the three great classes of so-tall.

VI.

All Articles, under the head of "Domestic Manufacture," it must be carefully noticed, are to be deposited in the Society's Rooms, on Monday the 8th, to be examined by the Committee, on the 9th, being the day before the Cattle Show. Persons offering them will hand to the Secretary, and all the necessary Certificates of the growth of the year, but must be forever repeated at stated intervals, or the hedge will attain such a growth,
as to shade and impoverish a considerable portion of your land. The greater part of 11 years
too, the field which this hedge is designed to inthe adoption of live hedges, as a general system ever restless and quarrelsome rivals for governof inclosure. This law, co-operating with public ment patronage, sentiment, is perpetually changing both directly and indirectly, the sizes and shapes of our farms. Divisions and subdivisions are continually making; and these again are removed, and many small farms so united, as again to form large ones. Unless, then, it can be benificial generally to the cause of our agriculture, for our planters and farmers to do, what they may know beforehand, that others must necessarily undo, or lose by the neglect, it seems perfectly obvious, that no kind of fences will suit our state of society, but such as are soon and easily made; and speedily removed to other situations, when found to be in the way, in their original positions.-In England, the dimensions and forms of their farms are secured in most cases for many generations, by their law of primogeniture, and by their clerical and noble orders. With us, the natural love of change, which prompts each succeeding generation to alter what their fathers have done, added to that necessity for alteration, which results from the nature of our institutions, renders it altogether impossible for either the shape or size of our farms long to continue the same. If, therefore, there are any situations in our country, where live-fences are preferable to dead ones, it must be only around yards, gardens, orchards, and along permanently fixed public roads. But even then, I have strong doubts, provided we consult economy alone, whether fences, such as I have described, of locust, cedar, or chesnut, either combined, or each wood by itself, would not be found to be far preferable. At all events, before we go any farther in efforts to rear live hedges, which in the Pens before 9, A. M. according to the num-

MASSACHUSETTS AGRICULTURAL SOCIETY.

The following papers are now published for pre-servation and reference. They may in most particulars serve as models for other societies, less experienced than the ancient and respectable society of Massachusetts-we should always be glad to get useful hints from any quarter, much more from one so eminently worthy of respectful consideration.- Edit. Am. Far.

To be observed at the CATPLE SHOW, EXHIBITION public sale of ANIMALS AND MANUFACTURES. at Brighton, on Wednesday, the 10th, and Thursday, the 11th of October, 1821.

Business will commence on each day, at 9 A. M. On the first day, the Trustees and Members of the Massachusetts Society for Promoting Agriculture, will move in procession from the Agricultural Hall, to the Meeting House, where prayers will be offered, and an Essay on an Agricultural subject will be delivered; and the

and putting up the materials. The posts of my we know that our children, or some other persons bers on their Tickets, as furnished by the Clerk.

Animals to be sold at Public Auction on the 2d day, (agreeably to notice in the Hand Bill for Premiums,) must be entered, and a description of the same given the Secretary on the 10th, to enable them to enter the proper Pens, on the morning of the 11th; the sale whereof, will commence in regular order, at 11 o'clock, precisely. An Auctioneer will attend to the sale, free of charge to the owners, who must be responsible for the delivery of their own Animals, in conformity to the conditions of the sale. The sale of Manufactures will commence in the Hall, at twelve o'clock. Proprieters of Goods will have a list prepared to hand to the Auctioneer; they are also expected to collect their own monies; it being fully understood, that the Auctioneer is only to bid off the same, free of any expense; and the sale will commence with the first entry, and proceed on regularly.

Any Members of the Society who have not received their Certificates, will find a person at-at noon, of the day succeeding the termination and attracted population to vacant lands. It is in the natural course of things, that settlers from Agricultural Hall, who will deliver them, on payment of Five Dollars, the sum agreed upon instead of all annual assessments. The same person will also, on application in season, furnish Tickets for their Dinner, at Dudley's Tavern.

XVII.

The Hall will be opened between the hours of half past 2 and half past 4 o'clock, on the 10th, rooms, during the hours prescribed.

GORHAM PARSONS, JOHN PRINCE, P. C. BROOKS, S. G. PERKINS,

Committee of Arrangements.

AN ACT

In addition to an act for the encouragement of AGRICULTURE and MANUFACTURES.

CANALS.

The attention, directed to canal navigation, in various parts of the United States, at the present exclusively for the Ladies and those Gentlemen moment, is highly honorable, and promises great content without a monopoly. who accompany them, for the purpose of seeing advantages, to the country at large. The glory, the Manufactured Articles. A person will be appointed to wait upon the Ladies through the in this particular, belongs to the state of New the first to complete, an artificial water commu-nication; but New York has a just claim to renown, as the successful accomplisher of a work, which, in boldness of design and rapidity of exe and powerful nation. It is asserted in the New Hampshire Gazette, that no less than five new canals are now in contemplation in the New Eng- of the republic. Sec. 1. Be it enacted by the Senate and House land states; and if our eastern neighbors direct

Ploughing Match, and the sale of Animals and Provided, however, that nothing herein contained posed canal may benefit Baltimore to the disadshall be construed to authorise such societies to vantage of Philadelphia, it is too grovelling to be seriously entertained: whatever is for the advantage of Pennsylvania, must be beneficial to Philathe consent of the owners thereof, or to occupy delphia; and as a multiplicity of markets must be of importance to the state, it will be the fault of Philadelphia, if it shall not derive a fair proportion of advantage and honour from every improvement on the borders of the state. In making the great canal, the enlightened statesmen of New York did not pause, because a large portion of the western trade would be likely to pass from the canal down the Susquehanna; they had the prosperity of the whole state in view, as well they did not check the one with the fallacious ex-

> With respect to canal navigation in our own state, as much is doing as is perhaps practicable in the outset. All that is said in Maryland about the vast consequence of the Susquehanna, is so much urged in favor of exertion in Pennsylvania; mere fact that we are in earnest attending to the union canal, has given a spirit to enterprise, the east and north should come into Pennsylvania: the migration of such persons to New York, has greatly contributed to its presperity, and a similar result must follow in this state. It is absurd, therefore, to imagine, that, any improve-ments made by Baltimore can seriously affect Philadelphia-the resources of Pennsylvania are equal to the supply of both ports, if each will be

But above all, the formation of canals will have so great an influence upon the minds, manners and in this particular, belongs to the state of New affections of Americans, by as it were concentra-York; it is true that Pennsylvania was the first ting them or attracting them to each other, that to make an attempt, and that Massachusetts was he must be a sorry politician indeed, who can descend to a calculation about local pecuniary advantages or losses. Our territory is extensive even to unwieldiness-its extent is unfriendly to a similarity of principles and habits; so that he cution would do honor to the most enlightened who gives the smallest aid to strengthen, by approximation the ties of political and social affinity, will contribute to the happiness and duration

FROM THE NEW HAMPSHIRE PATRIOT.

Turnips may be raised with advantage: they afford not only sauce for the family, but much food for cattle and sheep. The garden will yield a supply for early sauce, and new land the best for the table ir winter. But it is principally for the purpose of providing sustenance for cattle and for sheep that their cultivation is recommended.

Of this vegetable there are various kinds, but the Swedish turnip (Ruta Baga) is preferable. It is most productive, most nutricious and easiest to be

preserved for the future use of cattle.

They will grow in almost any soil when well prepared; but in a light soil, consisting of sand and loom, they may be raised in the greatest per-fection. They will flourish in a rich heavy soil, and the crop will be abundant, but too rank to be sweet.

In the preparation of the ground, manure, sowing and culture, and the harvesting and preservation of turnips, a method should be observed near-

growth and to admit the horse plough without injuring the plants. Half a pound of seed is sufficient to sow an acre. Before the seed is sown, it it is adviseable to put it into a vessel with water Rose, "are usually raised by our farmers among into lands of from one to two rods wide, as was and skim off the light defective seeds which rise their corn: but, although useful that way, I am found convenient, on account of roots, mounds, on the surface. The residue may then be rolled in lime or plaster and then sowed. The best time for sowing seed is from the tenth to the thirteenth ed by themselves. And it is useful for a farmer to ter furrows were cleared out by one or two extra of June.

More than eight hundred bushels of turnips have been raised to the acre; but four or five hundred dant root crops, he will feed his cattle to great dis- was found necessary to plough directly across, by may be considered as an average crop on good land well cultivated. The produce of such an acre will afford much food for cattle and sheep—it will be more than the hay which several acres afford. one acre will be equal to a ton of hay; but as these cannot be preserved long in a sound state, they should be given to the cattle when green-in that

When sufficiently dry the lands and prepare it for succeeding crops, " No person" The fact is they receive much nourishment from were harrowed, in the same direction they were says the Encyclopedia, "ever deserved better of the surrounding atmosphere, and appear to implement a country, than he who first cultivated turnips in the surrounding atmosphere, and appear to implement a country, than he who first cultivated turnips in the surrounding atmosphere, and appear to implement a country, than he who first cultivated turnips in part a portion of it to the land. Their roots plough and two yoke of oxen, these ridges were the field. No plant is better fitted for the climate strike deep into the earth and meliorate and preof Britain, no plant prospers better in the coldest part of it, and no plant contributes more to fertility. ing crops. In a word, there has not for two centuries been introduced into Britain, a more valuable improve-

ment."

As contributing to the supply of food for cattle, cabbage is an article that may be profitably raised are wet either with dew or rain as injurious, and tandem, and the earth to form the hills, taken in the field. By setting the plants three feet distant from each other on a line in rows running each ter the second hoeing, weeds should come up, it entire, and the crop secure from too much wet, way, so much of the labour may be done with a horse plough, so as to leave but little for the hoe. materially injure the beans. The quantity of feod, that can be raised on an acre thus cultivated is very great, and will afford much nourishment to cattle in autumn and early in winter, when grass fails and they require support from the barn. Nor is the labour great that is necessary for the culture of this vegetable; but to obtain a good crop, the ground should be previously plough-rience I have found them useful as food for sheep late glue boilers, fermented with leeched ashes and ed several times and well manured. Farmers, if in winter and early in spring.—CINCINNATUS, sandy loam. I was governed partly by necessity, they would make the experiment, would find this method of procuring subsistence for their stock less expensive and more profitable, than that of furchasing more land for pasturing and mowing. The extending the limits of our farms, and the neglecting the cultivation of what we possess, is an error that cannot too often be reproved. This error has been so long cherished, that it has acquired the force of habit. And every successful method of raising more food from less land has a ten- of Trustees I will endeavour to detail the mandency to correct the evil, and render the farmer more content with his farm.

It not only furnishes means for increasing the varicty of dishes for our annual festivals and other

It may be proper to state, that I have not sufbut have some seasons taken a second crop.

Brighton, 25th April, 1816.

STATEMENT OF THE EXPENSES OF FARMING.

Walton-upon-Thames, 12th Feb. 1822.

was given as a fair average of the expenses of no hesitation in saying, that the view that the to repay the delay.

farming in England, and was made upon a farm above letter gives is extremely imperfect. For tithe-free, and wholly arable, seed and keep of instance, in the article shoes, he has omitted the early in the season, but it produces a profusion of

scraper and followed on to the next, treating each horses having been reckoned at the importation additional charge that both the tanner and shoe ridge in the same manner till he had gone over prices, and labour at the rate of twelve shillings maker must make to enable them to pay the taxes fifteen or twenty, he then came about and re-lawek for a man. Further, that in the estimate on the various articles used by them, as well as turned by the side of his former track, till he had of the produce that accompanied the above, the the interest on the amount of duty advanced by performed the same operation over the whole—in some parts a second scraping was necessary.— a value put upon the green crops; that 5s. 4d. a The malster and brewer, besides requiring a As the scraper was light the man held it up till stone for live stock was required to afford, and larger profit to enable them to pay their taxes, he came to the water-furrows, or such places as that with these prices there was only a trifling must also charge interest on the duty advanced he wanted to take the earth from, and the work balance left after paying the expenses. First, I by them. This is the more needful, as their risk was not harder than to hold a plough in new have to notice that from the annexed statement from bad debts is more than tripled in consewas not harder than to hold a plough in new have to notice that from the annexed statement from bad debts is more than tripled in conserough ground. As there is no stopping, the oxen it appears that grain is at present 48 per cent. because of the taxes increasing the price of their article in that proportion. Surely the circumstem with a harrow of the same width of the scraper. After the ridges had been harrowed level, and the water-furrows cleared out, the whole resembled a field of turnpike roads. To each acressembled a field of turnpike roads and lone third of the produce of a farm, the above. and 3 pecks of timothy seed, sown, harrowed, and one third of the produce of a farm, the above rolled—the sowing was from the 20th September shews that it averages 46½ per cent. below what to the 1st November, and on most parts the seed has been proved to be needful, with the scale of vegetated before winter. It was my intention to expenses of 1821, to indemnify the farmer. Prohave kept a particular account of this enterprize, but the work, owing to wet weather, and other save from loss, the whole of the outgoings upon Poor and Church causes, became so blended with other operations of the farm, that it was found impracticable. I bethat is, 46½ per cent. The important inquiry Assessed Taxes & lieve, however, that it was found impracticable. I believe, however, that the potato crops nearly paid then is, if it is possible, under the existing taxalicum, to effect such a reduction. By referring to the annexed document it will be seen that seed, Keep of Horses 16.752 per do. of do. crops, including the extra expense, compared with crops, including the extra expense, compared with laying down common upland, did not exceed ten These being the only charges that farmers genelue of do. spring, as is usual. The land for four successive present state of things continue, this charge will lic expences, &c. 13.960 per do. of do. years since, without a dressing of any manure has averaged two tons per acre—not estimated tons, mit of corn being grown scale required, to admit of corn being grown scale required, to admit of corn being grown. mit of corn being grown at present prices, but the difficulty is in effecting the reduction in the Jan. 26th, being the fourth of the six preceding other half. With the exception of poor rates, I Feb. 15th. put in a barn by itself, and an exact account kept admit that all the charges that compose it may of the sales. The last season the crop was lightbe reduced, but that the reduction can be carried so far as 46½ per cent. I contend is impossible, without first reducing taxation to the scale of 1792. How much reduction, under the present bage. The value of the land in the estimation of taxation, can be effected I cannot undertake to many, who were acquainted with its former state, tion of the taxes in increasing the expense of the farmer, labourer, and tradesman, will, I think, fered the land to be fed with any kind of stock, be sanguine enough to believe that more than 25 per cent. is practicable. If then the charges which constitute this half of the expenses cannot be reduced more than the above, there will per cent., thereby leaving him only 7 per cent. I hope that I may be pardoned for intruding on the I need hardly add, that this is a consideration notice of your readers. ing what per cent. grain is below the importation not greatly reduced, they must operate indestroyprices. My object in giving these documents is ing not only the landed interest, but also the agto point out, that excepting an abatement of rents ricultural capital of the kingdom. In concluding,
is obtained of nearly 93 per cent, it is impossible I cannot forbear noticing a letter on the subject of
with the existing taxation for farming to be carried on to a profit with the present price of produce. Before proceeding farther it may be nemyself competent to shew the full extent of the
duce. Before proceeding farther it may be nemyself competent to shew the full extent of the

ON TARES.

Pump-court, Temple, November 21, 1821.

SIR,-The mention of tares made in your last Extracts from the last file of the London Farmer's Journal, received at the office of the American Farmer.

To allow farming to be carried on, which much less attention has been paid than and which will make a further reduction of his treatment of 46½ per cent., and which, added to the and inasmuch as every small stay which can retard 461 already reckoned upon, make a total of 93 the impoverishment of the farmer must be useful.

SIR, that ought to excite the most carnest attention of Of the vicia, properly so termed, there are mamy estimate of farming expenses, published in certain effect in my opinion of the present circu-your Journal of the 2nd April, 1821, showing lating medium (gold at the old standard of £3.17s, what per cent. the different charges are of the 10½d, an ounce) is to establish a low scale of total expenditure. I also add a statement, show- prices; and if under such a scale the taxes are ing what per cent. grain is below the importation not greatly reduced, they must operate indestroy-bage, so rich, so bulky, and so many crops in the

rich fodder late in the summer. It is also prolific a few species which I have in growth, of the gene-of seed, and it possesses the happy quality of not ra, lathyrus, ervan, and lens.

articles of beer and British spirits is very nearly equal to the decrease in wine and foreign spirits. of seed, and it possesses the happy quality of not being stifled by grasses when it is intermixed in meadows. It thrives in the stiffest clays, even in those which are very poor, and in reducing such to permanent pasture, this plant, if the seed can be procured, should never be omitted. The seed of this also lies long in the ground, and the plant does not attain maturity till the third or fourth summer, but it seems of long duration afterwards. It therefore seems desirable to discover a fit course of crops with which this may be so combined that the ground may not be unproductive, while this plant is attaining its maturity: perhaps, if sown with wheat early in autumn, and if clover be sown

in spring, it might succeed.

Of the annual tares, it may well be doubted whether any will ever be found much superior to the real winter tere, (vicia sativa) hardiness, nutritive quality, and bulk, being all considered. It is well known to be much superior, in the two first of these qualities, to the vicia lathyroides, or spring tare, although the latter surpasses it somewhat in bulk, and much in the rapidity of its growth. The Canadian lentile or white tare is probably more grateful to sheep, because the haulm is slenderer and finer than either of the two last preceding plants; this, if sown in autumn, comes into blossom a fortnight sooner than the winter tare but it suffers much more from a severe winter than does the common winter tare. If sown in spring at the same time with the spring tare, the Canadian lentile blossoms about a week before the latter, as I proved in the last summer. It is tolerably prolific of seed, which surpasses in brilliancy of colour the most delicate pea, but the plant is much smaller in bulk than is the spring tare.

Another annual tare, of which I have conceived the highest hope, is a newly discovered species, which Mr. Vilmorin, an eminent botanist at Paris, has named vicia pseudocracca, from its resemblance to the vicia cracca: this sown in September, had a decided advantage over the winter tare in the month of April, in the luxuriance of its growth; and it kept the superiority both in height, and probably in weight also, during the whole summer. It flowered most profusely, but it had been sown too thick for its habits of exuberant growth; and the seed pods rotted under the bulk on the ground. It promises a great abundance of early food for ewes and lambs, and probably would this charge is as follows: bear a second growth after once feeding, sufficiently ample for the purposes of hay or a seed crop.

Vicia Monantha is too tender to bear severe winter, if sown in autumn, in wet land; in a rich warm sand, and after a moderate winter, like the last, it The surplus, therefore, of £2,500,000 may be naparte, he passed a law, that all farmers in and its herbage is very considerable. The narrowness of its leaf renders it (unless thickly sown) less capable of smothering weeds than the broadleaved winter tare.

The duty on wine is £8,620 less this year than in sugar was selling in France at five shillings per the preceding; and the demand for foreign spirits pound: this circumstance will give Mr. T. some idea of the nutritious quality of mangel the winter tare.

£102,306 between the duties of two years: tobactory that to the manner of cultivation. I must leave that to the able hand of your The vicia biennis and vicia sylvatica (after sev- co and snuff, no slight sources of enjoyment to a tion, I must leave that to the able hand of your extension of their vegetation to a second year does that source. As a set-off to these reductions, it appears to compensate for their deficiency of bulk and difficulty of growth.

The land (a sandy soil) was prepared as for Swede turnips, addition of no less than £158,722 to the revenue good rotten dung placed in drills, at 18 inches I have several other species of tare, of which of the preceding year, while the drinkers of beer distance in the rows, and my plants were full 12 at present I know so little, that it does not become have supplied a quota of £76,750. The companiches apart; the seeds were planted the last me to offer an opinion on their value: after another very rative cheapness of British spirits has also creative week in April, not exceeding two inches under year I shall be better acquainted with their worth. Should these lines be deemed worthy of inserduty) of £42,364 above the former year. It is tion, I shall, at a future time, state my remarks on somewhat curious, that the increase on these two culture of Flanders.

So that, perhaps, the balance in comfort, as well as in revenue, is pretty nearly equal. As for those who have sacrificed their taste for tobacco and snuff, we suppose they have sought consolation in tea, for here again the increase and decrease are nearly equal.

WURTZEL.

Herefordshire, Jan. 25th 1822. Sir-It is rather unusual for a man to write on a subject, which he professes to be totally ignorant of; and in addition to this, your correspondent Mr. Thorpe, in his letter of January 3rd, seems disposed to doubt the veracity of one who has planted and used mangel wurtzel for several years past: however it is done openly, and in an inoffensive manner; therefore I freely forgive him.

I have neither leisure nor inclination to enter into a controversy with Mr. T.; but I deem it necessary to answer his letter of the 3rd inst, and to repeat, for his satisfaction, if he pleases, that " I weighed five wether sheep and put them into a barn, as stated in my letter of the 12th ult. and in that situation they were regularly supplied with 25lbs. of mangel wurtzel (less than three roots) and 5lbs. of good hay during every 24 hours, for each sheep, and this continued for five successive weeks, at the expiration of which time they were weighed out, and had gained upon an average 8lbs. per quarter." It seems to strike Mr T. with wonder, that animals should gain so much more than he states they would gain, when at grass in the month of May and the following months; but when it is considered, that the sheep were penned up in a warm barn, and without the possibility of exercise, they were much on a footing with pigs in a stye, fed on barley meal and pease, or like unto turkeys, if cram-med with the best Carolina rice. It is not at all extraordinary for animals having an aptitude to The revenue of the year ending the 5th Jan. fatten, to make still greater progress, when fed any one to convince him of its extraordinary properties: it is possessed of greater specific gravi-ty than that valuable root, the Swede turnip. Perhaps Mr. T. is unacquainted with the fact, that during the reign of that enterprizing man, Buothe debt of £800,000,000 as £2,500,000 will purpose of making sugar, and which experiment chase. in those articles which are considered luxuries, tions; good sugar was produced at one shilling

I remain your well wisher.

PEDIGREE OF HUBBACK. Elemore Hall, Nov. 19, 1821.

channel of your paper, by hearsay evidence and otherwise, to question the blood of Hubback, I pily rested, with gentlemen farmers at C*ld dering those that use them more beautiful; and send you his pedigree. I have the authority of Sp***g and B********d W**d. Mr. Charles Colling to say, he always considered him a thorough-bred Short-horned Bull. Mr. hear—but to bring some new champion forth, to but the application of various arts to hide their lington, says his father bought her of Mr. Stephenson of Ketton, and that she was a pure-bred Short horn. Mr. Alexander Hall, of Sherraton is, Short Horns, or Devons I should buy. Hill Top, who lived in that neighbourhood, and remembers her and the calf perfectly well, says she was a beautiful colour and handler, and when she got on to good land near Darlington, she got so fat she would not breed again. Hubback, he says, was got by Mr. Snowden's bull, a son of Mr. Robson's bull of Dinsdale, who was bred by old Mr. Waistell of Burdon, a very noted breeder, and got by Mr. James Masterman's bull, of the same if necessary.

I consider the name of Improved Short-horn to come from the breed of Hubback, and Mr. Maynard's cows, which, from time and judicious crossing, have brought them to their superior excellence. No cow or bull can ever be called a Short-horn with a cross of Scotch blood; for I would just as soon put the Duke of Grafton's Penelope to a Scotch pony, to breed a racer, as a cow to the grandson of Bolingbroke, out of a Galloway cow, to breed a Short-horn.

Your obedient servant, GEO. BAKER.

To cleanse the teeth, and improve the breath. To four ounces of fresh prepared lime water, add one drachm of Peruvian bark, and wash the teeth with the water in the morning before breakfast, and after supper. It will effectually destroy the tartar on the teeth, and remove the offensive smell arising from those decayed.

TO THE EDITOR OF THE AMERICAN FARMER. SIR,

As a novice in Agriculture, I am anxious to know with what breed of cattle, you would now stock a farm. I have read in new books, and have seen in the Farmer, so many accounts in no formed; it can then be made if properly done, a that butter, lard, or oil, may be used.

the surface, with a small planting stick, taking wise agreeing, that I am led to enquire the result fine pickle. We all know how delicious roastin care not to put more than one pod (which con- of experience, rather than rely upon the opinions ears are; when fit for this use it will make a sutains more than one seed) in each hole; the plants of theorists, before I discard, for the favorites of perior starch; if scalded and dried you may have make their appearance in about 21 days; and the day, the stock of my grand-father's farm .when about the size of cabbage plants, care was At one time, Alderney's were in fashion; fitted grain is hardened, you have for all the domestic taken that only one plant remained in a hole; for every purpose; suited to every soil; peculiar-they were kept clean by a single horse hoe in the ly adapted to our climate; to all but our purses. of the shock or husk, by slitting them finely, make rows, and hand weeding between the plants: af-Next came North Devons in turn; their beauty, excellent matrasses or under beds. The flour or ter having had immense quantities of the large agility, vigour, and shape, had attracted the eye meal of the grain is the most wholesome we use; leaves taken from them during the last four of the "rich Mr. Coke," and had been honored months they were in the ground, they were pull-by mingling in "Holkham Park" with his Deer. ed up about the end of November (but this great- As milkers, we are told they were unrivalled in done were I only to give you the receipts for but I think it matters not which. Baltimore County, 23d April, 1822.

of these discussions by a flat palpable demonstra-tion—if we could? On no! It is our opinion that of water, when it boils stir in as much fine corn as "much may be said on both sides," as upon meal as will make it the consistence of paste and got by Mr. James Masterman's bull, of Coatham, near Darlington, and was a true-bred Short-horn.—The above Gentlemen will attest the same if necessary.

Indictingly be said on both sides, as upon when cooling they may add a spoonfull of honey when cooling they may add a spoonfull of honey sees and the great Czar; let the controversy go on; and a little rose water, though the latter articles only have recourse sometimes to facts.—We hope are not necessary—let them use this paste, or as I the same if necessary. the contest will not be decided until all the best vulgarly call it, mush, instead of soap every time breeds have been introduced-one of which may be they perform their morning and evening ablutions, most advantageous for one part of the country and or, in other words, wash themselves. I venture to another for another part.

Editor American Farmer.

ING AND EMPLOYING INDIAN CORN.

TO THE EDITOR OF THE AMERICAN FARMER. There are many things the rich have no need to the hoor; if they had the knowledge necessary my enumeration one use to which I put that valuable grain, worthy of being more generally known. In order to swell the list I mention some of the purposes for which it is used, that are known to every one; before I enter into the detail of preparing a dish, which I consider the best, healthiest, and most palatable food we have, I will begin with it before the seed is perfectly

roasting ears in the middle of winter. When the skin smooth, transparent and white—and withal it is perfectly safe; only let them try it instead of going to one of those venders aforesaid, and spend-Would the writer have us destroy the interest best will only be of transitory benefit, leaving a affirm their complexions will derive more advantage from the application of this paste, than any of those washes which they pay so high for.

I come now to the preparation of the grain, ON THE VARIOUS WAYS OF PREPAR- which I believe is not as generally known as it ought to be, considering its excellence. It is what we call lyed hommony; we likewise have the best hommony and small-hommony, both of which are common, are fine dishes and superior to rice when to think of, which would be of infinite advantage properly managed; but the lyed hommony is preto turn that product of their labour they have ing more wholesome and more palatable. It is most in their power, to their own comfort—you prepared by boiling the white field corn in ashes may perhaps smile when you perceive this pream- and water, until the husk or skin of the grain is ble is to usher into notice the virtues of Indian loosened, which will be the case in a few minutes, corn. I will allow you to do so, if you can find in and it is necessary to pay attention that it does not remain too long in the ashes, as it will by that means taste of the lye—so soon as the husk is loosened, it must be washed and rubbed through the hands in cold water until the grain is cleansed from the ashes and skin, it may then be dried to make use of at any time, or boiled immediately

^{*} A word in Domestic Cookery which implies

if wanted. When ready to be cooked for the table, it must be scalded and put over to boil in either warm or cold. It is also used in this country by the Indians and Creole boatmen, who prefer it to any thing else in a soup, by putting the mony, has become so fond of this dish as to de- logs; they are near water, have a south expothe same, were they equally to make the trial. I have been induced to write the preceding.

A Missouri Farmer's Wife.

Editor's Correspondence

ELERIDGE, May 5th, 1822. TOBACCO BEDS.

If my ground had been ready I could yesterday have transplanted two acres from rough hot-beds, which I made on the 5th of March. I shall next Cattle Show, a large concourse of distincransplant from them this week, however, without waiting for seasons. The plants which I we fear that the number of animals exhibited, might have set out yesterday have leaves each will not equal publick expectation. It is to be apas large as a dollar, and with their stem and prehended that many who have fine animals, will not send them from the fear, either of the trouble beds made at the same time will not give me or of their being excelled. If all were actuated plants fit to be removed under six weeks at the by this sort of indolence or pride, we should have soonest, which brings me to the middle of June, nothing for exhibition; it is well known that mawhen the sun has great influence, and planting ny of the animals which took premiums at the seasons are precarious. Last year, depending last show, might have been beaten by hundreds of chiefly on field beds, I pitched a large part of the same species, if it had been anticipated that my crop in the first week of July, and was such would be brought. The society have at conpressed closely by frost when housing this in Siderable expense, erected a number of additional pens, and made such accommodations as ought rough hot beds, I shall plant my whole crop to induce all true friends of these rational and usefrom these, and before the close of May; ful exhibitions, to bring out whatever their farms whereas if I had relied upon field beds this year, I could not, owing to some peculiarity of the of notice; such as are not offered for premiums

I send to you herewith, some plants from my hot-beds, and others from my field beds; from these you may form an idea of their relative condition, for the plants are selected from qualities of the best to be found in either kind of my beds. My corn planting will now be finished in days prior to the show, to J. S. Skinner, Post Masthree days, so that nothing can interfere with tobacco planting, until the time for hay making comes, and long before then my tobacco crop will be established. Is it not important to planters, to be thus certainly assured, as they are by the hot bed system, the day on which they may begin and complete their planting and housing?

What would not most of them give to have their crops pitched, and off hand before haymaking, and corn-tending comes on? What, to have their tobacco ripe in August, ready to be housed half cured, by the drought and heat of that month; uninjured, because unseen, by the latter glut of worms; and completely out of the way, when we should be saving corn-fodder, fall grain, and seeding.

Much as planters would gladly give to be as-sured of these facilities, of this certainty of order, and regular succession of their labours, is it not wonderful, nay almost incredible, that they should neglect the easy, cheap, and obvious means of accomplishing objects, so desirable which I thank you; in return I enclose and so important. and so important.

they would have done better, if sunk a foot at promises to be very generally cultivated in this plenty of water, observing always to keep suffi- bottom, below it. During frost they were co- part of our country."

cient hot water ready to add to it as the first boils vered with straw mats made about 3 inches Potatoes—Irish Potatoes from the Hon. S. L. away. The grain bursts open into a white ball thick and 5 or 6 feet square-the warp of whiteand becomes soft when sufficiently done. This oak slips, straw for the filling, and this bound to is the manner we boil it to eat with milk or cream, the warp strips, by passing a smaller slip band New Jersey, from the neighbourhood of Man-either warm or cold. It is also used in this coun-around the straw and warp. The mats were supported above the plants on a ridge full 12 inches high, and laid on from each side, forming a corn over with a piece of beef or pork, leaving comb at top as roofs do. My rough hot-beds are flavour. the water init which makes the soup—in the other long narrow pens of logs: they are about the water init which makes the soup—in the other high, or two logs; 4 feet wide, and the length case the grain is taken out of the water. great advantage and saving of milk.

pose of white washing, as it does not smell, and it has also a more durable whiteness.

The most simple, and perhaps the most wholesome way of boiling potatoes, is in an untinned eaten at funerals and obsequies of the dead. iron pot or sauce-pan; when boiled, pour off the water, and let them continue over a gentle fire;

the plant has been found to have vegetated so tion than of the nature of the plant.

It is still the custom at the hospitals in France to burn rosemary with juniper berries, to correct impure air, and to prevent infection. The custom of using it at funerals may have had re-

ference to this virtue in the plant.

Without entering into the extravagant opinions of the ancients respecting odours, we cannot avoid thinking that the effect which different smells and perfumes have on the mind, as well as the health, is not at present sufficiently attended to.

Most people acknowledge to have felt the refreshing odour of tea and coffee before tasting them; and in heated rooms the fragrance of a cut lemon, or a recently sliced cucumber, has been observed to give general refreshment.

The ancients held certain odours in the highest veneration. Among the Israelites, the principal perfume of the sanctuary was forbidden for all common uses. The smell of the incense and burnt offerings in their sacrifices was thought to dispose the mind to devotion; while others were used to excite love. "I have perfumed my bed with myrrh, aloes, and cinnamon." Sire, some perfumes were prescribed to procure pleasant dreams; whereas others were deemed of a contains at what he thinks the growing fashion of sature the blades, and cutting and carrying rails at what he thinks the growing fashion of sature the blades, and cutting and carrying out the tray effect. It appears that they also employed ving a field of corn, by the speedy method of ta-tops, hauling in, stacking or stowing blades, and odours as a nourishment when the frame exhaust-king each hill off, stock, blade, ear, top and all, thatching the fodder house. In the first method the ed; as it is related that Democritus, when on his at a single stroke, if skilfully applied, with a carting will require perhaps three times the numdeath bed, hearing a woman in the house com-sharp tool. ROSEMARY .- It is still the custom in some ers, that indicated heaviness and signs of death. If you begin to cut off in time to have good fodparts of this country, as well as in France, to Clemens Alexandrinus attributes the abstinence der, you have "shrivelled corn;" and yet F. put a branch of rosemary in the hands of the dead, from beans to the opinion that they occasioned again says, "to the North where the grain is the when in the cottin; and we are told by Valmont sterility; which is confirmed by Theophrastus, chief object, they cut it off before the fodder is Bomare, in his Histoire Naturelle, "that when who extends the effects even to the plants. Ci-dry;" of course not to the injury or shrivelling of the coffins have been opened after several years, cero suggests another reason for this abstinence, the grain, or they would not do it. Indeed we anow viz. that beans are great enemies to tranquillity the northern grain is generally very perfect and much that the leaves have covered the whole corpse." This account savours more of superstition than of the nature of the plant.

The plant has been found to have vegetated so much that the leaves have covered the whole to have abstained from them, even before Pythactorn. And if F. is correct, that it can thus be goras, that he might enjoy a clearer divination taken off while the fodder is green, why cannot

if prepared in the following manner: Steep them will appropriate a turning row of 25 or at most 30 in warm water for about six hours; then boil feet in width through the middle of your field, them in river water in a new earthen pot, glazed and rick your corn on this, of the size of one or in the inside; when about half boiled, to a quart two cart loads each, well put up, with a hole of beans add two ounces of honey, and about a through the foundation lengthwise, made by plagrain of musk; after which let them boil for a cing the first buts a foot apart, and roofed off by short time. Select a clear part of the water, and putting on the last covering buts up, and well inthrow in a few of these beans early in the morn-terlocked over the top or ridge, the haul will be ing, and again at evening, for two or three days, shorter, than the haul of carrying your blades which will draw the fish together, and they and tops at once to the barn and fodder house may be taken in a casting net in great numbers. yard, and your corn will be every ear saved, and

FOR THE AMERICAN FARMER.

February 15th, 1822.

a solemn feast which she had a great desire to see as far south, as parts of Virginia. And if found "4th. You increase your labour by present the feast was past.

I should hope that this "fashionable," yet neverbut suppose every day to be favourable, you cut the sprigs of this plant were formerly stuck theless excellent method, will every where reto beef whilst roasting, and they are said to ceive a fair trial; and if it does, it must prevail red you must again pick them up and carry them wherever wheat is to succeed corn.

Our next example shall be drawn from the commonly tremendous storm of wind and rain on he first Monday of September last, blew the fodier to ribbons; and should the method of saving be blamed for not making that good, which had been previously ruined? But this same storm world, man was formed. The Romans at one into the alternate rows; or to scramble the wheat time believed, that the souls of such as were de- in after any fashion among the corn lying in every parted, resided in beans; therefore they were direction. The two first will take nearly as many hands, and as much time, as the whole pro-Varro relates, that the great priests or sacrifi-cess of cutting off and shocking the corn on the

by his dreams.

The Egyptian priests held it a crime to look order. Cut off and put immediately up into saying, that to eat beans, and to eat our father's mistaken, these are the desirable points to attain ad, were equal crimes.

Beans make one of the finest of all baits for fish, haul in your blades and top fodder; and if you in nice order to go to husking out the moment you have finished seeding wheat. And I am clearly of opinion that the fodder, together with the stocks and corn of a field, can be cut off, shocked, cured, carted off, and ricked on this middle turn-

Compare the two methods closely. If you have to the turning rows and place them in heaps for the essential oil, which was much esteemed for all af-der; for it is within the recollection of most far-fections of the brain. over and collect them into bundles and tie up; mers in Virginia and Maryland, that a most un-again you go and collect into arms full, and carry

operations and three times travelling over the surface of your field; and if you set down the coming empty and going out loaded with each arming operations each at two traveles over the field. Therefore by the time you have got your blades and tops deposited on the turning rows ready for your carts, your hands have actually handled the blades three times, and the tops twice; and have walked seven times over the surface of your field.

Now for the other method—at every blow of the

has not been travelled over once and a half, taking into the calculation every inch of back and forth movement. Here is one handling and one and an and lofting—four operations.

What is left to do in the old mode? the field has leen already by this mode travelled seven times over; go over it again, and gather the corn; again to throw with the carts, and stock are still untouched—and lam within the truth when I say, that the same hands with the tarm hands were not muck, go in the wheels and heavy oxen hands were not muck, go in the wheels and heavy oxen muck, and trample and tear up your hopes of a creased, and your corp crop wound up in a short. I am within the truth when I say, that the same hands will cut off the whole plant and shock up the produce of a field in half the time, that they can pull, cut, tie in bundles, and carry out the blades and tops of the same field. And of course by half the number of days that it will take to save your tops and blades, can the hauling in the aw method begin earlier, than in the old—and with this advantage in the start, and the shorter haul; the operations of saving and clearing the field of the whole plant, and ricking up on the middle turning, can be effected and completed by the same day of September that you could finish your blades and tops, without injury to your teams and without a minute of night work. In the old way most of your blades must at least be tied up way most of your blades must at least be tied up in. after night, if not carried out.

out to the turning row, at least three distinct been covered up, never to be recovered—at least journey of half a mile with every single car of the operations and three times travelling over the sur- 20 per cent. of the whole crop of ears are lying other bushel, to get it to the same place; you

Now let us endeavour fairly to collect the active farmer to condense into a month or 6 weeks tount and strike the balance; seven journeys and the work, that is often scattered through the greater part of 5 or 6 months, viz. the blade strike the blades and tops, to pull, and three years out of four, it will be blown down, and your wheat will go in slovenly and unfarmerlike. In the new way you have a clear field before you, and if necessary can start harrows before your seed ploughs; an excellent method, by which the surface is levelled, the crust softened, and every and lays where the seedsman threw it; if the field is grassy, this harrowing clears the way for three more field journeys and three operations.

Now let us endeavour fairly to collect the active seven journeys and tops, to pull, and tops, the work, that is often scattered through the greater part of 5 or 6 months, viz. the blade greater part of 5 or 6 months, viz. the blade and tops, to pull, and tops and tops to pull, and tops and pokening and tops to pull, and tops and pokening of September, the corn setting up and picking up of October, the corn gathering and hauling in of November and December, and the stock getting of January and February.

I would wish to state the whole case fairly; I have been supplied to the stock getting of January and February.

I would wish to state the whole operations, whole operations, and two field journeys—cutting off stocks, picking up stocks, loading and hauling in stocks, the folder in its most valuable state. To

Now for the other method—at every blow of the cutter (and he will not make one more for the whole field, than did the top cutters,) the whole of the noble plant yields to his power, hill after hill falls into his arms, and if a right angle turn is made with every arm full, the cutters of each two eighth rows have only the width of seven rows to carry them out of the straight line of march.—The carriage of each of the other two corresponding rows to the shocks, is less and less out of the straight line, till you get to the two centre rows, which have no deviation. Thus by the time the field has been felled, level with the earth, and placed in shocks of 16 hills each, ready for the carts, you have performed but two operations; it has not been travelled over once and a half, taking all up where the corn is husked, and carried to the corn house, the fodder to be ricked up on the same turning, enlarging there of the corn house, the fodder to be ricked up on the same turning, enlarging their size by putting three of the corn house, the fodder to be ricked up on the same turning, enlarging their size by putting three of the corn house, the fodder to be ricked up on the same turning, enlarging their size by putting three of the corn house, the fodder to be ricked up on the same turning, enlarging their size by putting three of the corn house, the fodder to be ricked up on the same turning, enlarging their size by putting three of the corn is well as would be supposed; the gathering and hauling in will throw the old mode behind the row making them safe for winter, if mod as much as would be supposed; the gathering and hauling in will throw the oloss in and hauling in will throw the loss in and half taking allow they even maken turning, enlarging their size by putting three of the corn house, the fodder to be ricked up on the same turning, enlarging their size by putting three of the corn house, the fodder to be ricked up on the same turning, enlarging the row in the fodder to be ricked up on the same turning, enlarging Now for the other method-at every blow of the be husked, and carried to the corn house, the heap; but after a little custom the difference is

petty and time consuming operations, it enables Now let us endeavour fairly to collect the ac-the farmer to condense into a month or 6 weeks

rain lays where the seedsman threw it; if the field is grassy, this harrowing clears the way for the ploughs and accelerates the putting in. Your wheat goes in with ease and comfort, and equal to a nicely prepared naked fallow. In the old mode, at least two years out of four, your wheat las been put in with much trouble and botheration—as well as you could, to be sure—but not at all to your mind; and you have been in a constant sold, for the month of October; now with the setters up, then with the pickers up, now with the poor ploughman who is sweating and doing his best, for covering up the ears of corn, then for not lapping his first furrows, now for hauling in the pickers up, then, for his plough's jumping out and missing ever so much.

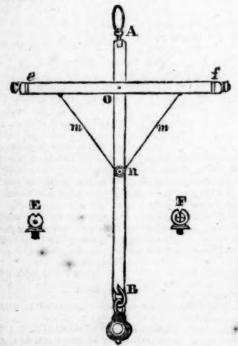

At the end of the job, the corn stocks lay across and athwart in every direction, much corn has seen and athwart in every direction, much corn has seen and athwart in every direction, much corn has seen and two field journeys and three operations, loading and hauling in stocks, loading and three operations—making twelve travels over the face of the whole take the fodder in its most valuable state. To take the fodder in its most valuable, take

and may then be cured in a high state of perfection unless it shall receive injury from the quantity of juice or sap, which still remains in the cob, and may produce a white mould among the grains. It is the difficulty of making the large pithy cob, in the centre of each ear of southern corn, cure without giving this mouldiness to the grain, that forms the only serious obstacle to this labour saving plan, which also so handsomely increases the bulk of provender, as well as manure; and for myself, I would sooner put off commencing the operation of fodder-saving for a week, than give up the method.

POTOWMACK.

TO THE EDITOR OF THE AMERICAN FARMER. Essex, April 8th, 1822.

J. S. SKINNER, Esq. Dear Sir,-As the method of cultivating hilly land, by horizontal ploughing, is now coming in-to very general use; and as its efficacy is often counteracted by the inaccurate manner in which it is executed, and the awkward expedients adopted neighbouring farmer, who has tried it with perfect success.

AB and CD are two rules, or light strips of wood of any convenient lengths, say two feet and fifteen inches respectively; crossed and let into and at the same time try other similar substances. each other at right angles, at O, the shorter one being horizontal. At A, there is a loop and ring to suspend the instrument; at B attached by another ring is a lead weight of a few ounces: at e and f, are fixed the sights, E and F, the one next the eye has a small round hole in the centre, the farther one has a large circular hole with cross threads; m m, is a silk or small wire stretched tight and wrapt once around the thumb and the sights, but the farther one has a large circular hole with cross threads; m m, is a silk or small wire stretched tight and wrapt once around the thumb and the same time try other similar substances. Upon beds each a yard square, I last spring sow-following with matter infinitely better, and far more data; some of the beds were spread over with nimportant and interesting, than it is in my power sible in my rejoinder to what has fallen from an acre. Other beds were spread over with nimportant and interesting, than it is in my power sible in my rejoinder to what has fallen from a cre. Other beds were spread over with nimportant and interesting, than it is in my power sible in my rejoinder to what has fallen from a cre. Other beds were spread over with nimportant and interesting, than it is in my power sible in my rejoinder to what has fallen from a cre. Other beds were spread over with nimportant and interesting, than it is in my power tree, in fine powder, in different quantities; the too offer, I certainly shall be as concise as possible in my rejoinder to what has fallen from a cre. Other beds were spread over with nimportant and interesting, than it is in my power tree, in fine powder, in different quantities; the too offer, I certainly shall be as concise as possible in my rejoinder to what has fallen from a cre. GROWTH OF TIMBER TREES.

ed.) there is an interesting letter on the age, bulk, and increase of timber trees, with the measureparts of the kingdom. Probably, the instances are familiar to many of our readers, but they cannot fail light upon the most interesting part of the inqui
y an inch the fourth, and 1-3 the fifth, and 30

ry, namely, the progressive increase of timber trees, and the probable age of those which are of thus:

The first century, 1½ inch

The first century, 1½ trees are yet standing, and known in the neighbourhood, of any of our correspondents, we shall be much obliged to those who will take accurate measures of them, and transmit the account to the Office of The Farmer's Journal.

Extracts from a Letter from R. MARSHAM, Esq. to THOMAS BEEVOR, Esq. of Hethel, near Nor-wich, dated Stratton, October 1, 1799.

" In compliance with your request, I here send you the measure of some of the largest trees taken by myself, in several rambles about the king-dom. The largest oak I have seen, is that by Coltsthorp, near Weatherby, in Yorkshire, of which the ingenious Dr. Hunter gives a plate in his edition of Evelyn's Silva. The Doctor calls this tree 48 feet in circumference, at 3 feet from the ground; and I found it, in 1768, at 4 feet, 40 feet 6 inches; and at 5 feet, 36 feet 6 inches; and posing it grew in the above proportion, it was not understand the disease in all its stages;—it 500 years old when he came to the throne, and evidently proceeds from surfeit. A horse rode unevidently proceeds from surfeit. A horse rode unevidently proceeds from surfeit. is the height I always measure at, as easier to see eleven yards in circumference." the level of the string, and also being clear of the swellings of the roots.

was at 7 feet high, 34 feet in circumference, not more rapid than is shewn above; it would his wearied limbs;—and the stable being wet or There is a large excrescence at 5 and 6 feet, that very much help to confirm his reasoning, if we damp, and the horse in a copious sweat, are rea-would render the measure unfair. In 1778, this tree could now receive accurate measurements of the sons the best that can be given, for the formation had increased only half an inch in 19 years. [That trees in question.

FREDERICK COUNTY CATTLE SHOW AND FAIR.

At a meeting of the committee of arrangement, on behalf of the Frederick County Agricultu-

ral Society,

It was resolved, To distribute premiums, amounting to \$102, at the Cattle show and Fair, to be held on Thursday and Friday the 23d and 4th of May next, at the Monococy Bridge Hotel, two miles below Frederick-Town, on the Baltimore turnpike road, in the following man-

I, to w	It.	
Forthe	best Stallion	\$15
ditto	Brood Mare	10
ditto	Bull 18 months old	15
ditto	Bull less than do.	7
ditto	Cow	10
ditto	Heifer	5
ditto	Ram full bred merino	5
ditto	Common do.	5
ditto	Pair of ewes	5
ditto	Boar	5
ditto	Sow	5
ditto	Litter of pigs, not less than seven in number	
	and not less than 3 months nor more than	3
	6 months old	
ditto	Yoke of working oxen	10

Ordered, That all the stock to be offered for premiums, must be on the ground, and reported in writing to the secretary, at or before 9 o'clock,

Ordered, That all stock, offered for premium, must have been raised in or intended for the im-

provement of the stock in this county.

The committee regret they cannot offer at although beneficial to the few that are engaged in and growing manufactories of France to tear, she this time premiums for implements of Agriculture; they however confidently invite the exhibition, with a view to the inspection of the public, and for sale.

Ordered, That a sale of stock and Agricultu-

Even these useful practices too are often disfigured by a fantastical mixture of super-* About one acre and a quarter American stition and empiricism. When, for instance, we read in Cato a minute description of an incanta-

Columella directs us to save our vines from mice, extirpating broom-rape from the fields, is to draw on five shells the picture of Hercules strangling a lion, and bury one in the middle and one in each corner of the field-when Democritus will ensure us a thriving garden, if we bury an ass's head in the middle of it-when some of the most sober writers gravely describe the remedy by which the broom rape may be driven from all fields, and making allowance for the essential difference becaterpillars banished instantly from gardens, which was to make a barefooted, half-clad woman, with her hair dishevelled, walk three times culated to inspire a mingled feeling of admiration round it-when these, and many similar directions are given by the great masters of the sci-complished, and surprise at what she has neglectence, they must be received as evidences of its ed. She has many advantages: her exuberant extreme imperfection. Indeed, no one who will capital, her commerce, her manufactures, furnishcompare the rude plough of the Romans with the ing to agriculture so large a body of domestic admirable instruments of France and England, or consumers, have enabled her to cover a large will contrast the writings of Columella and Sir portion of her soil with a picturesque and beauti-John Sinclair, can fail to acknowledge how much ful cultivation, which no stranger can contem-

we may derive more instruction from their descendants. So naturally do our recollections bandry. dwell rather on the past than the present Italyso much more are we attracted by its ruins than by its prosperity, that we have not sufficiently admired its agriculture. Yet Italy is probably at this day the best cultivated country in Europe.-It supports from its soil a population greater in proportion to its extent than any other; and such again estimated, that one-fourth or one-fifth is its admirable system of culture, so triumphant might be enclosed and cultivated, and the rest its industry, that, though suffering from the employed for sheep or for planting timber. The worst of all evils, oppressive and profligate gov-consequence is, that she does not raise grain ernments-although a great extent of country, not less than 200 miles long, and from 25 to 60 importations of wheat and wheat flour, during the miles wide, is in a considerable degree lost to last twenty years, having been about four millions perhaps greater than at present. They have ac-complished this, by substituting for the long fal-which it is for her alone to decide. But even a lows of antiquity a judicious rotation of crops, and stranger may be allowed to perceive, that, with- half of the rent. by terracing the feet and sides of the mountains, out abstracting capital from other pursuits to reso as to render them eminently productive. The claim waste lands, the deficiency of England minute division of the soil forms the peculiar feature of its agriculture. When the influence of of a better husbandry on lands now under cultiva-instruction rather from their success than their Christianity had abolished slavery, the manumittion. "A very small portion," says one of her misfortunes. And truly there is something admited slaves, who were then the only labourers, best authors, Dickson, writing in 1804, " a very rable in the generous and buoyant and elastic became tenants, and have so continued to the present day. Five-sixths of its population are small farmers, working the land on shares of one-half or one third. These cultivators of a few acres have rendered their country so fertile, that from one end of Italy to the other-from the irrigated meadows of Lombardy to the volcanic regions of Naples, if we except some parts of the Pope's dominions—there is scarcely a single spot which does not produce the utmost which its situation and natural fertility admits. The eye rests with delight upon the magnificent prospects 1812 and 1816, we learn from the valuable wriof Piedmont and the Milanese; on that busy tings of Dr. Rigby, that some of the very counscene of industry, which sustains a population of ties which Dickson considers as the most perfect, fourths of the gross produce is disposable, and wretched system of fleet ploughing and whole where the fields are constantly covered with a succession of varied and abundant harvests. The that Sussex " is behind almost all others, at least amount of produce which enabled the farmers of half a century"—that in Cheshire the articulated. succession of varied and abundant harvests. The district near Vesuvius has a population of 5000 souls to the square league, a proportion unknown system of a century back still prevails-that yielded by some of the finest soils of Italy. If to any other part of Europe: while in Sorrento, their rotation of eight crops in five years, and one of them a cotton crop, is pronounced by a compe-tent judge to be "the best managed and the most

application of manures, a rapid succession of crops, probably not inferior to those of any other who would improve in scientific farming. would often suggest modes of culture, better adapted to our climate than the practices of England, which we are too prone to follow without tween the seasons of the two countries.

The general cultivation of Great Britain is caland surprise: of admiration at what she has acscience and the mechanic arts have contributed to plate without satisfaction. Yet a nearer inquiry excites astonishment, that this very success has not induced a more enlarged and better hus-

There is an extraordinary difference in the calculations of British economical and statistical wri ters on that subject; but the safest estimates show, that a proportion of from one-third to nearly onehalf of the surface of Great Britain is waste and almost unproductive. Of these waste lands, it is enough for her own consumption; the average small portion of the cultivated parts of the island has, even at this advanced period, been brought country have upheld its agriculture, under a comunder a judicious and well conducted system of plication of burdens, such as never before preshusbandry. Immense tracts of land, of the more sed on the soil of any country. By her peculiar rich and fertile kinds, may be still met with in condition-by the poor laws-the tithes-the taxdifferent parts of the kingdom, that are managed es of every description, England was reduced to in very imperfect and disadvantageous methods of a condition which demanded all the energies of farming;" and he adopts the calculation of Sir the farmer, and tasked to the utmost every re-John Sinclair, that 30 millions of acres are either source of capital and invention. On a moderate in a state of waste, or cultivated under a very defective system of husbandry. Even still later, in Shropshire is subject to a very inefficient cultiva-indeed we were to select any district where skill tion; and that in short "a great part of the and capital have been most successful against nakingdom is in a lamentable state of agricultural tural obstacles of climate, I incline to think we unproductiveness." Some of these defects are should name the Lothians of Scotland. productive of any in the world."

It is however rivalled, if it be not equalled, by many parts of Flanders; where from a soil more fertile than Italy, though in a climate less genial, he used the drill husbandry for sixteen years be-

may be charmed back into their places-when they extract from their land by industry and the fore any individual followed his example; and even now his improvements are supposed by himby trimming them at night during a full moon—crops, probably not inferior to those of any other self to extend about one mile in a year. Other when Sotion declares that an effectual mode of country. The details of Italian and Flemish hus-causes, however, are not wanting, and some that bandry—the Italian rotation of crops, and the to us seem almost incredible. For instance, near-Flemish management of cattle and manures—are ly one-half the arable land of England is held in worthy of attentive study by all in this country, common; its culture is therefore subject to restrictions either of custom or law, and the portion of each commoner is often so arranged, that he cannot cross-plough his land for fear of trespassing on his neighbour. These, it may be easily imagined, do not produce more than half the value which might be drawn from them, by enclosure and exclusive possession. Again, the fault which is constantly deplored by her writers, and one that seems peculiarly strange where the economy of human labour is so well understood, is the superfluous expense of cultivation by the multitude of horses. It is at this day common in England, to see four, five, and six horses following each other in single file, before a plough, in fields of a few acres, and in soils where two horses might easily accomplish the work; to see teams of four horses employed, where two would be quite sufficient; and this notwithstanding the successful introduction of the Scotch mode of ploughing, as in this country.—
The consequence is, that England and Scotland are estimated to contain 3,500,000 horses, consuming the value of 450 millions of dollars, and the produce of sixteen millions of acres, being neary one-half the productive lands of the kingdom. The condition of a large proportion of the tenants too, is, in many respects, unfavourable .-The soil of England is owned by about 40,000 persons, and a greater part of the leases are at will, or for a short term from five to nine years, the better policy of long leases not having yet became general. Lastly come the tithes and taxes; the tithes, which take from three fourths of the cultivation, by the malaria, which has depopulaof bushels a year, amounting to nearly thirteen occupiers of land in England and Wales, oneted the fairest part of the old Roman empire;
or fourteen days consumption. Whether it be
tenth of the gross produce, even when the restill the absolute amount of its produce was never desirable to resort to the waste lands to supply mainder may afford no remuneration for their labours-and the taxes which, combined with the

Na- To us the example is peculiarly interesting, in labour, manure, and other articles, are about the cause of form in animals, are either since our climate resembles that of Spain in its five thosuand dollars a year. His operations are all on a proportionate scale. To contract to pay Judicious observers, by the union of similar culated to repair. It is now almost an established a rent of twenty or thirty thousand dollars; to ex-pend in a single year, on lime alone, eleven thou-these qualities, and established at length distinct shall arrive a critical season, during which the insand dollars; to pay two thousand dollars a year for breeds with very decisive superiorities over our tense heat of our long days is not relieved by rape cake to manure turnips; to make a compost ordinary cattle. These should be sought by good rains, and our crops, just as they are verging to rape cake to manure turnips; to make a compost heap, costing four thousand dollars—such are the combinations of wealth and skill which produce good husbandry. These we cannot, and we need not, imitate. But they may teach us that we should measure our enterprises by our means; and we are frequently misled into the which have no natural facility to fatten. This sought by good rains, and our crops, just as they are verging to maturity, are suddenly checked and injured, and sometimes destroyed, by the burning influence of the sun. But instead of struggling to overcome animals, and we are frequently misled into the characteristic spirit of the country, sit down by and that an ill managed farm can no more be the which have no natural facility to fatten. This sought by good rains, and our crops, just as they are verging to maturity, are suddenly checked and injured, and sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence to them. But we are too often sometimes destroyed, by the burning influence of them. But we are too often sometimes destroyed, by the burning influence to the sum and the sum are too of them. But we are too often sometimes destroyed, by the burning influence to the sum and the sum and the sum and the sum are too of them. But we are too often sometimes destroyed, by the burning influence to the sum and the sum are too of the sum and the sum are too of the sum and the sum are too of t profitable than an empty factory. Men praise is a mistaken pride, productive of no immediate failing streams, and lament the decay of their the bounty of nature. It is much safer to rely good, and the more to be regretted, since the harvests, touching the river banks, without one on her justice, which as rarely fails to reward capital actually lost in feeding bad animals might effort to convey to these fields the water which have imported good ones. then, though small, are generally too large for our capitals; that is, we work badly too much The cattle are left to feed almost exclusively on improvements of Spain and Italy; and he will be ground, instead of cultivating well a little. In hay in winter, instead of being supplied with a great benefactor, who shall exhibit a cheap the estimates of finance, two and two do not al- roots, more nutritious and cheap in themselves, and efficient mode of irrigation. If the first exways make four—in the arithmetic of agriculary and the culture of which is among the very best pense be beyond the means of an individual, it ture, two are generally more than four. It is preparations for the succeeding grain. The exwave may be accomplished by the union of interested wonderful, indeed, how profusely a small spot tention, on a large scale, of the root culture, neighbours, and almost any expenditure would of ground will reward good husbandry. There would alone, I am satisfied, give a new face to be justified by the success of a plan, which would alone are in Italy hundreds and thousands of people, the agriculture of the state. In the use of these, at once render our fields twice, or five, or ten

ductive and hazardous investment of capital. grow on two acres. There are in Switzerland some hill sides, formed into terraces, which have sold for two thousand dollars an acre; and in fortunate spots for gardening, as near London, a single acre will yield a clear profit of from eight to pipe hundred dellars a year. These examples to pipe hundred dellars a year. These examples the fields of layuriant yearstation, they lie acre will ductive and hazardous investment of capital. This belief has contributed much to retard our husbandry. I myself think it entirely erroneous. My impression is, that a capital employed in judicious towards the provident to let them eat and waste at pleasure. We are more respectful or less judicious towards a clear profit of from eight traint fields of layuriant yearstation, they lie with a contributed much to retard our husbandry. I myself think it entirely erroneous. to nine hundred dollars a year. These examples traint, fields of luxuriant vegetation; they lie suits of a life among us, and probably superior to to nine hundred dollars a year. These examples traint, fields of luxuriant vegetation; they lie may perhaps explain, how without the great capitals of England, and without diminishing our farms, we may gradually render them richer and more productive by judicious culture.

The characteristic merit of modern farming seems to be this: The old practice was to draw stought to them, and successive grain crops, and then leave the productive to they make the suits of a life among us, and probably superior to down upon it; they trample it under foot; in the profits of farming in other countries. For wet weather their foot-prints commit injuries to the average profit on farming in England, with which we are most habituated to commit to the pare ourselves, is from ten to fifteen per cent. Now, in this country, the profits ought to be greater. The question might perhaps be decided by seems to be this: The old practice was to draw kept under comfortable shelter, and their food is the single fact, that while the greater part of ground and successive grain crops, and probably superior to down upon it; they trample it under foot; in the profits of a life among us, and probably superior to the profits of farming in other countries. For the profits of a life among us, and probably superior to the profits of a life among us, and probably superior to the profits of farming in other countries. For the profits of a life among us, and probably superior to down upon it; they trample it under foot; in the profits of farming in other countries. For the profits of a life among us, and probably superior to down upon it; they trample it under foot; in the profits of a life among us, and probably superior to the profits of a life among us, and probably superior to down upon it; they trample it under foot; in the profits of a life among us, and profits them. The modern system seeks to restore the pastured, and the additional expense of cutting is England, the renters of farms of about fifty acres, ent parts or at different depths of the soil from the preceding. It has, therefore, for fallows, has scarcely made its appearance in this coun-which describes, at once, the measure of that wretchedness which could appease or defy even

price of agricultural productions. In this coun- ished it from their farm yards. try they form a proportion so inconsiderable,

that farm work in Pennsylvania is very little dear- the ordinary price. In July last, the average of These calculations are, of course, not applicaer, if it be not actually cheaper, than in England. The comparison is difficult, because at this discense we have not yet seen all the effects which the embarrassments of the last two years have five to ninety cents, and at the present moment, produced on the rate of wages—because their without any foreign demand, it may be stated at nowever direct the ordinary price. In July last, the average of These calculations are, of course, not applicable to the remote farmers, whose markets are habitually less valuable, and who are now suffering under the extinction of the accustomed demands from about. Their embarrassments should, produced on the rate of wages—because their without any foreign demand, it may be stated at nowever direct their industry to new channels; nominal wages are generally swelled by perqui- about one dollar and ten cents. The flesh mar- and there are, fortunately, now presented to the sites, and because in a country, where every kets are also considerably higher in England, farmers of Pennsylvania, two distinct branches sixth or seventh person is legally a pauper, the But wheat forms only one-fourth of the crops; of industry, which may enable them to retrieve poor rates are in fact only a disguised increase and in the articles of turnips and potatoes—in their losses, and give a new impulse to the husof wages. But, rejecting these considerations, the root crops generally, the price is probably bandry of the state. I mean to speak of the and taking the average wages of day labour to higher here than in England. The great staple growth of wool, and the cultivation of flax and be what it was in 1810, fifty-five cents (2s. 6d.) of wool is certainly dearer in this country. hemp. -and it is not probably now less near London- These elements will enable us to contrast with The consumption of woollens in the United even this does not, I believe, fall more than our own, the condition of an English farmer, States cannot be less than twenty or thirty milabout twenty-five or thirty-five per cent. be-whose rent is three times as great, whose taxes lions of dollars, of which the greater part is low the price of day labour in the same district are twenty times as great—manures more expennear Philadelphia. But the nominal price of la- sive—labour not much cheaper—and prices, on
exact as to the amount, since my purpose will be bour is a less fair mode of comparison, than the actual expense of executing any given work in the two
countries. Now, we have more long, clear, good
they pay higher rents. Near London or Edinworking days, and our workmen—as I have spoken burgh they can afford to pay for wheat lands
working days, and our workmen—as I have spoken burgh they can afford to pay for wheat lands active, more intelligent, and more dextrous in in spite of all their burthens-in spite of wool growing countries; and this, while we postheir labours. Not to speak of the axe, in all the uses of which they have no rivals, I believe that three Pennsylvania farmers, with their ples from other branches of industry. There can have been the victims of the most extraordinary scythes fresh ground and their tough ash cradles, be no fairer measure of prices, for instance, than caprice. When the war of the Peninsula threw might stand before any wheat field in Europe, the expense of removing, by manual labour, a into this country some of the very best breeds of and challenge twice or thrice their number of given quantity of earth; that is, of excavating Spain, they were eagerly purchased at extravareapers. This is no exaggeration. Sir John a canal, though all the benefits of experience in gant prices. But, in too many instances, the Sinclair, in his work published as late as 1821, that business are certainly on the side of England. owners were deceived by calculations of their says, that three good reapers will cut an acre Yet, yard for yard, a canal may probably be very small consumption of food; and they omitof wheat in one day. Now an American cradler will, in a field with the average crop of England, cut three, four, and even more acres in one day. He further calculates, that the cutting and binding of this acre will cost fifteen shillings, from which, if we deduct 28. 6d. as the wares of the which, if we deduct 2s. 6d. as the wages of the recently made by the Company for constructing binder, who performs his part in half a day, a canal by the side of the Schuylkill, are in some there remains 12s. 6d. or \$2.75 per acre. Now, cases as low as seven cents per cubical yard: in allowing a moderate average of work for a cra other and feculiar cases as high as twenty-eigh other,—three acres,—and a high average of wages,—one dollar,—the American acre will be eut at the price of thirty-three cents, and the cubical yard.

their respective expenses and profits; that is, English acre at two hundred and seventy-five a freight of 3000 miles, a commission to

TO THE EDITOR OF THE AMERICAN FARMER.

DEEP TILTH-Importance of-how best accomhlished. BREMO, April 25th, 1822.

SIR,

For some time past, I have been impressed with the idea lately expressed in the American Farmer, by Mr. Briggs, as to deep tilth-and of Easton, concerning "Sedged Wheat," a short description of which, he at the same time gave. A reference to communications made by Z. Holof his substratum plough.

It cannot but be flattering to find in myself a coincidence of opinion, with two gentlemen so

science, and rural economy.

You will therefore excuse my troubling you

agriculturists.

My own practice has been to run a single mediately following the plough. I find the average depth which a strong horse will carry the coul-I believe this insect is the same as that known ter to be seven inches and although one cut slice of a two horse plough) may not leave the From about the 25th of April to the 20th of May a very small white worm, resembling the vinegar eel, but somewhat thicker, may be found and not then, if the season is dry. vinegar cel, but somewhat thicker, may be found and not then, if the season is dry.

about the root; and at the same time, an imanimate insect attached to the root, resembling the cel, is nothing more than a surcharge in the soil of ter within the narrow space of each furrow cabbage louse, only smaller. The latter I have these insects, which clover multiplies if it does which could not be effected without the power cabbage louse, only smaller. The latter I have supposed was not really of the Aphis tribe, but merely the chrysalis of the destructive little larva. The roots are always diseased, often dead, and frequently covered with a loose sheath or casement, not found on healthy roots. About the latter period mentioned above, the earth in the latter period mentioned above, the earth in the particular food, a cause of failure on a repetition, now so fashionably urged by cheter to adopt any course making double teams every where, but especially near to the metroponecessary.—I am inclined to think two coulters, lis. six inches apart, drawn by a pair of horses, might pay under some particular circumstances; but, as a general practice, in the present state of Since our last publication we have been

FOR SALE,

Three hundred and thirty-two acres of LAND, n Baltimore county, about eight miles from the city of Baltimore, near the Turnpike road leadng to Havre-de-Grace, and between that road and the turnpike road from Baltimore to the Bridge over the Susquehanna, near Rock-Run. The White Marsh Run, a stream of water which never fails, passes through this land in its whole length, and affords sites for grist-mills, saw-mills, or other works requiring water-power; and the springs on it are admirably adapted to be useful for distilleries, tanneries, etc. and a portion of it is also adapted, by its form and aspect, for a vine-yard. Plaster of Paris is used to advantage on the lands in its neighbourhood. This land is rich in its soil, and nearly all covered with heavy timber: only about forty acres being clearednearly one half this tract is rich meadow land .-It is adjoining the lands of General Ridgely, of Hampton, and the dwelling mansion of John Ridgely, Esq. is close to the southern line of this land; a part lies high and commands extensive views. A liberal credit, if required, for a large portion of the purchase money may be had. Apply in Church street, Baltimore, to

sindnded

This experiment was made upon an uneven it where horses and milch cows were confined during the winter. In the autumn of 1819 the stable was removed, and the lot and the adjacent land, to the amount of 3 acres and more, was broken up, and in the year 1820 cultivated in tobacco without any manure being ap-plied, except one bushel of plaster paris, sown broad cast just before the hills were made. The crop of tobacco was very great. The ground, after the tobacco was cut, remained untouched during the winter. On the 2d and 3d days of March, 1821, it was broken up with two ploughs, that is, one which cut very wide, was first run, and another more narrow followed in the same furrow, breaking the land about 10 inches deep.

15th of April, laid off the ground in rows seeach to go over two acres in this way. But the result, as extracted from my diary of that from the circumstance of my extending the year. experiment over a greater space than two acres, and the distance of the barn yard, and one cart only being employed, the manuring was not completed in less than ten days, all which time the manure remained exposed in the furrows.

26th of April-The manuring being completed, a list was formed upon each row of manure by running a large plough on each side of it, and the piece of ground above my shop in corn, in drills sure wasted. We might indeed select level The corn was covered with the hoe. Near two follows:

John Rogers of this county, and call it the red Cobb. filled even full, after being somewhat trodden It is remarkable for shelling out more than any with the richest stable dung, four were filled other kind I have seen—and was introduced, I with half rotten chaff upon which cattle had understand, into this county several years ago been wintered, and two were filled with dry by Mr. Craven Peyton of Buck-Island. On the unrotted wheat straw. A list was then formed 29th of April an excessively hard rain fell which upon each furrow by running a large plough washed up a great deal of the Corn. This was once on each side of it; and double rows of corn replanted the 5th of May, and the damages of planted in the furrows left by forming these The following new Members were elected. the rain, in some respects, repaired.—Many of lists. The corn was thinned to the same dis-Doct. 0 FROM A LONDON PAPER. FOREIGN CORN.

These documents show the error of the great figlitico-economical oracle of the world, Adam Smith, on the subject of foreign imported grain. He is equally wrong in twenty other great points.

EXTRACTS FROM THE EVIDENCE TAKEN BY THE AGRICULTURAL COMMITTEE.

One of the most important of the subjects on which evidence was taken, is the rate at which foreign corn can be imported into this country.

Dr. Smith had observed, "that the small quantity of foreign corn imported even in times of the greatest scarcity, may satisfy our farmers that they can have nothing to fear from the freest importation." This conclusion, however, it was maintained had been completely falsified by experience, and the most extravagant assertions respecting the price at which corn could be raised in foreign countries were hazarded both in and out of Parliament.

John Christain Curwen, Esq. M. P. stated in

evidence before the committee :-

" I should apprehend that the price of grain in that the speculator, in the first instance, gains probably not much less than a bundred per cent. by it, and that the cause of bringing it to this country in the quantities that have been so ruinous to it, have been the enormous profits expected by the importer."

John Ellman, Esq. stated, as on the authority of different importers of grain, and particularly a gentleman living at Lewes, a very large mealdeed have been reported to us, in the course of relax in our efforts to promote its adoption, but man and merchant, who showed him several letters both from Dantzic and Hamburgh, that-

"White wheats and red wheats to weigh 61 Board, have given us, for extending the benefits and 62 pounds a bushel after paying the freight, could be delivered at Newhaven harbour, near Lewes, at from 32 to 34 shillings a quarter; the freight would be about four shillings a quarter; that they could buy it at 28s. to 30s.

" Did he state that as the usual average price,

Mr. William Stickney .- "I have an account of any longer that disfigurement of the human face, number of deaths by inoculation; an evidence the prices of foreign corn abroad; at Antwerp which was obvious every where some years since, quite irrefragable, and, as it appears to us deci-wheat may be obtained from 34s. 6d. to 3/s. 6d.; wheat 22s. 6d. to 30s.; oats, 11s. 6d. to 11s. 8d.; at Liebau, from 30s. to 33s. for wheat; and oats of flowering, in different seasons. If, therefore,

"Then there is the freight to be added to

these near places.

he the price of 40s. per quarter upon wheat; and good would be attained. we do it on this principle, that wheat may be imported upon an average of years from 30s. to 35s. into the port of London."

Mr. Tooke, who for many years has been extensively engaged in commerce with Russia, de-livered in accounts of the prices of wheat at the May 17—1820, May 2d—1822, May 1st. various ports of Russia, from 1814 to 1820, and of the cost delivered in the port of London.

The following, according to Mr. Tooke, are

£2, 11s. 6d.—1819, £1, 14s, 8d.—1820, £1, 10s. 4d.

From Archangel, 1814, £2, 1s.—1815, £1, 16s. May 14th—1817, May 7th—1819, May 13th—1816, £2, 1s.—1817, £2, 18s. 4d.—1818, £2, 1821, May 11th—1822, May 4th. 7d.—1816, £2, 1s.—1817, £2. 18s. 4d.—1818, £2, 6s. 1d.—1819, £1, 10s. 7d.—1820, £1, 4s.

15s. 5d.

it was delivered in the port of London :-

From Petersburgh, in 1814, £3, 1s. 3d.—1815, £2. 14s. 5d.—1816, £2, 14s. 7d.—1817, £3, 8s. -1818, £3, 2s. 6d.-1819, £2, 4s. 11d.-1820, have had for nine years. £1, 19s. 8d.

From Archangel, in 1814, £3, 5s. 3d.—1815,

4s. 4d.—1816, £3, 4s. 11d.—1817, £4, 3s, 5d.—

Exclusive of granary rent, and fire insurance, and exclusive of interest of money and of the may be of some use, we should say, that when merchants' commission when on consignment, and the Apple tree flowers, we may safely (be it potatoes quite plump, and entire in taste, to the also exclusive of the liability to damage, and of sooner or later) venture to put our corn, squash-end of September, or till the succeeding crop be getting out of condition during the voyage.

At Odessa, wheat would stand rather more than

the market; and while the best British white 39s. to 43s.; Courland, 44s. These are the prices quoted for what is free."

SOME PAST SEASONS.

3d, For the greatest quantity of Rice, the The account is as follows: produce of one acre of either High or Low On hand April 1st, 1821, 8 Land.

4th, For the greatest quantity of Root or Slip Potatoes, the produce of one acre, of either High 1 shote (last spring pig) puror Low Land; the acre to be square, and not more chased in October, and 1 than 210 feet square; the crops must be planted and harvested, within the period of 12 months.

5th, For the best Calf, one year old, raised by the competitor, and exhibited at the said meeting in January; this premium to be continued anaually, until the animals reach the age of five

6th, Also a premium of Ten Dollars, or a Silver Mug of that value, for the best Hog, raised by the 79 bushels corn and competitor, not more than one year old; this premium to be awarded annually until the animals 21 bushels corn reach the age of three years. Should the animals 90 bushels rye exhibited not be deemed above mediocrity, the 11 bushels oats Society will not award a premium. Relative to 56 bushels barley the Crops, a detailed account of the mode of culture, and preparation of the land, is requested. It is expected all candidates will produce such tes- Wash from the house, valued at 15 timony as to prevent any doubts relative to the correctness of their statements, in regard to the Time in taking care of the age of their Animals, and the Produce of their Fields.

JOHN S. BELLINGER, President. JENNINGS O'BANNON, Sec'ry. Barnweil Court House, Jan. 28th, 1822.

FROM THE KENHAWA SPECTATOR. SALT.

the manafacturers have sold the whole of the Profit in keeping the swine It is extremely gratifying to the public, that salt, they are limited to make this year, to Messrs. Wm. and Robert M. Steele. Persons having any trade of business on the Kenhawa river, must feel it to be their interest, that this arrangement has taken place.-The sale has been made to those gentlemen, at a moderate Nov. 20 price, and upon very accommodating terms; which will, without question, enable them to supply the markets in the western country, at a Janua very low rate, and to come in competition with Feb. any salt in the United States. They have taken the precaution in their contract, to stipulate, that the salt shall be of the first quality .-The manufacturers of this article, are sensible On hand March 31st 1822, 6 hogs estiof the importance of attending to this particular; and of the injury Kenhawa has hitherto sustained in its reputation, by neglecting to have their salt made perfectly pure. They are determined this year, that their salt shall be equal in quality, to any, either imported, or manufactured in the United States.

TO THE EDITOR OF THE AMERICAN FARMER.

Worcester, May 12, 1822.

JOHN S. SKINNER, Esq.

Sir-Having noticed in your paper a few weeks requested Mr. Rufus Porter, of this town, to furnish me with the result of an experiment made, the swill was made by putting 2½ bushels meal, the is of too respectable a character to be willing, the result of an experiment made. by him the last year, for the purpose of ascertaining the actual expense in keeping swine, and how far they would be profitable to those who should keep a greater number than sufficient to consume merely the waste of the house. He was so obliging as to exhibit to me his book on which the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which an apartment which will be sufficiently worm to the grain is charged at the several times at which are the several times at which an apartment which will be sufficiently worm to the grain apartment which will be sufficiently worm to the several times at the the grain is charged at the several times at which it was carried to mill for grinding; and at the bighest market prices in this place. As the several times are which will be sufficiently warm to enable him to make use of fermented swill dubighest market prices in this place. As the several times are months. He thinks that the ring the winter months. He thinks that the saving in grain in using fermented, in prefer-given to the hogs by Mr. Porter, was not scalded,

2d, For the greatest quantity of Grain, the gate of the several kinds of grain, which I caretion and with his assistance.

\$327 341

I have not been able to learn that there is any since an account of the profit in keeping swine, 1 thing peculiar in Mr. Porter's manner of feeding by enquiries of his more immediate neighbors,

1st, For the greatest quantity of Grain, the prodices of one acre of High Land. dice of one acre of High Land. dice of one acre of High Land. dice of one acre of High Land. though he has made no experiment to ascertain the relative value of the different kinds of grain as food for hogs, he is of opinion that rye

is the most profitable. The food mentioned in this statement, was all that was consumed by the hogs; no vegetables were given to them, and being confined in yards they had no opportunity to obtain other food for themselves. Had vegetables been used, I am satisfied that the expense would have been diminished, and the quantity of manure much encreased, consequently the profit in keeping them would have been greater. Much manure of a good quality may be made by the assistance of swine in furnishing them from time to time with weeds and other vegetables of no value; the giving them to hogs to consume and to be made into manure, would occasion but little trouble and the expense would be very small. This might be done at a leisure moment, and the advantage to the land in clearing it from weeds, would be a full compensation for all trouble and expense.-That the value of the manure made by a hog supplied with suitable materials and properly kept at work, is greater than that of the grain necessary to fatten him, I have no doubt. I believe that the profit on this kind of stock, might under other circumstances have been greater than in this instance. The hogs, with which this account commences, were inferior of their kind, certainly below mediocrity; the aggregate of the 8 when fatted being only 1876lbs. which is less than 6 good hogs should have weighed. Notwithstanding this, I think that Mr. Porter has realized a greater profit than he has credited .-The grain he has charged at a high market price, and not at his own door, but in the centre of the town; and to have effected a sale at the prices quoted, he must have conveyed it to market, at \$327 341 as much trouble and expense as to convey it to mill for grinding for his hogs; therefore that part of the charge might have been omitted, but as he was desirous of ascertaining what would have been the expense provided he purchased all the grain they consumed, perhaps this expense is properly set down. The wash from the house is estimated at a high price; he keeps a dairy of 6 cows, but the hogs have no benefit from it, excepting the butter milk and whey, and his family is not large. The mud carted into the hog-yards was from the opening of ditches, which he was obliged to remove from the land, and could as easily be placed in his hog yards as elsewhere .-The valuation of the hogs on hand at the expiration of the year is certainly not extravagant, and they might really be sold at the price at which they were appraised. The valuation of the manure is reasonable. The hogs I saw several times during the year, they were kept in good condition. It is to be observed, that it was not the intention of Mr. Porter in keeping this account to lay it before the public; it was done for his own information, he therefore could have no inducement to attempt to deceive himself, and I have not been able to discover either by my own observation, or

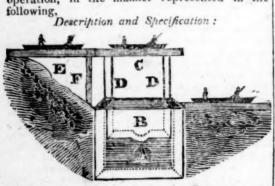

it into swill, in all cases where it is practicable, as more profitable; it causes it to ferment sooner and is believed to yield more nourishment.

FOR THE AMERICAN FARMER.

THE ECONOMICAL HYDROSTATIC LIFT.

A Desideratum of superior importance in Inland Navigation; being a very convenient and exexpeditious operation, so arranged, upon a new plan, that an uninterrupted succession of ascending and descending boats, or other craft, with their cargoes on board may, with the utmost facility and safety, be floated over any common summit-level, or incidental impediment in the Route, to which only a small portion of water, can be constantly brought; very little more than will be required merely to restore the unavoidable waste, daily result-ing from evaporation and absorption; in consequence of the same supply being retained, in such a manner, that it will always be ready, and may be used over and over again, as often as occasion shall require.

The plan here proposed is considered as being susceptible of a very general and advantageous application, comprehending all the practicable varieties of purposes and situations incident to Inland Navigation of every description, where-ver the object shall be, to introduce, improve, or extend any water communication, by means of interposing one or more Lifts, between two or more levels or sections of the contemplated Route. It may, for example, be carried into effectual operation, in the manner represented in the

In a rectangular well, A, of sufficient length, breadth and depth, let an air chest, B, of the required magnitude be so immersed in water as to be near the bottom when it is lowest and under times 50 are 400; and 3 times 400 are 1200 cu-the surface when in its highest situation. By suitable posts or pillars, DD, of iron or wood let a number of half hundreds in the tonnage proposed. moveable section of canal, or water Route, C, be Had the weight of 40 tons been assumed, instead moveable section of canal, or water Route, C, be securely supported in a perpendicular situation of 30, the depth of 4 instead of 3 feet, would tion, through the open gates into the upper caover the above mentioned air-chest, at whatever height shall be necessary, to correspond with the and 8 wide to have remained the same. height of the intended Lift. This moveable section is to be constructed of wood; open at both the well and the size of the moveable section will ends; but as near each end as will be conveni-require to be adapted. It is evident that the ent in practice, a gate is to be closely fitted, to length and breadth necessary for the latter, being sufficient, will immediately cause the air-be made in such form or manner, and of such must be sufficient for it to receive the Boats or chest to descend, in the well, to its lowest situmaterial or materials, as upon trial shall be found to be the most effectual in preventing lts depth must be so adjusted, that it may con- be brought to co-incide with the lower Trunk. leakage, and in promoting their being opened and tain a quantity of water sufficient to form an equi- where it is to be secured with the safety fastenshut with the greatest facility .-

level, E, supported by pillars as at, F, and the est situation. In determining the size of the upper extremity of the lower level, G, at the well it will be necessary that its inside dimenplace of the proposed Lift, be made to ter-sions, shall so far exceed the outside dimensions minate in a trunk of wood; let each extre- of the air-chest, that the space between them, and made to flow back into the moveable secmity be furnished, also, with a gate similar to shall be sufficient to admit the water to flow tion; provided it shall be prevented from runthe gates in the ends of the moveable section; freely through it; otherwise, in the event ning ahead by introducing a gate a little forward

brought into contact, and forced together by in proportion, and may, possibly, be rendered means of clamps, or otherwise, little or no wa- so slow, as to occasion great detention. The ter will be suffered to escape. In determining proper allowance, however, will require to be the ground plan, these trunks are to be located determined by actual experiment, at least upon in the most eligible situation, and at the requir-a small scale. Until this shall be done, perhaps ed distance, from each other, for the moveable the distance of eighteen inches or two feet all section to be alternately connected, with either, round, would be deserving of a trial. as occasion shall require.

in consequence of the air-chest and moveable secmay be obviated by means of four suitable iron, least at the surface of the water, as long as the or other projections, being made fast to the required position, to upright posts of wood, extending from the bottom of the well, to the top shall have attained their highest or lowest posifastenings, as may be deemed the most convenilected to such a depth; that by means of a pump, ation. it can readily be so far exhausted, that the residue shall not be productive of any material dis-

reasonably be expected to be the subject of its operation. Should it be concluded, for examfor a greater weight than 30 tons, an experimental calculation might be thus assumed: It is un- ed as, derstood, that the weight of a cubic foot of water, is about 624 pounds; but to make a competent allowance for leakage, in case it should occur, let only 56 pounds, that is half a hundred, be estimated as the weight of that proportion of a cubic foot that may, in this instance, with certainty be applied. Agreeably to these premises the number of cubic feet in the capacity of the airchest would require to be equal to the number of half hundreds in 30 tons; that is 1200: admit, then, that 50 feet long, 8 wide, and 3 deep, were assumed for the dimensions in question; 8 have been the result, admitting the 50 feet long,

librium with the air-chest; or even to prepon-derate, and cause both to descend to their low-Let, both the lower extremity of the upper derate, and cause both to descend to their low-

he not then having a convenient place for doing it, and let the respective ends of the section and of the intermediate space, in this respect, being but it is wise to scald the meal before making tranks, be constructed of the same size, and so too limited, the ascent and descent of the Boats fitted and adjusted that whenever they shall be and their cargoes, must, necessarily be retarded proper allowance, however, will require to be

> Under a due consideration of the foregoing Any inconvenience that might otherwise occur premises, it must be conclusively evident that the natural tendency of the air-chest, will be, tion deviating from their perpendicular situation to continue to float, either partly above, or, at quantity of the fluid which it displaces shall be corners of the former, and four others to the specifically heavier than the weight of its own corners of the latter, at right angles respective-pressure, into the water, added to the weight ly with their sides, having notches provided in of its incumbent appendages. But let a prepontheir outward ends, that shall be adapted to slide derating portion of weight only be added to upon four iron or other guides, attached, in the the said incumbent weight, so that the displaced quantity of the fluid shall be specifically lighter than the pressure of the said weight into the of the Lift. Any premature ascent, or descent water, and it will then follow with equal certainof the air-chest, and moveable section, after they ty that the air-chest will necessarily descend, together with the moveable section, to their tion, may also be prevented by the application lowest situation. And because the said de-of such clicks, springs, or other appropriate scent was produced, merely, by a preponderating weight being added for the very purpose of ent for that purpose. And in the event of the producing that effect; it can only be necessary air-chest being so constructed, as to be liable to take away the preponderating weight so adadmit a small portion of leakage, a suita-ded, to cause the air-chest, immediately, to reto take away the preponderating weight so adble cavity may be provided in the bottom, into ascend with the moveable Section, by which which the water shall, from time to time, be col- means, they will both regain ther former situ-

> Thus it appears that the air-chest and moveable section may be made to descend and ascend, the former in the well and the latter between The magnitude of the air-chest must be the upper and lower trunks, at pleasure, mere-adapted to the heaviest tonnage that may ly, by a small preponderating addition to, or deduction from the weight incumbent upon the air-chest; after the original weight shall have ple, that it would not be necessary to provide been previously adjusted to the capacity of the for a greater weight than 30 tons, an experiment-said chest. Hence the following may be adopt-

The manner of Operation :-

Admit the moveable section to have been elevated to its upper situation, and the safety fastenings to have been applied; also the quantity of water to have been adjusted to the capacity of the air chest and the moveable section, to have been connected with the upper trunk. Then, in the event of there being a descending Boat in the upper level—let the two gates leading into the moveable section be opened and the Boat propelled forward into the said section. As the Boat advances, whether it be empty or loaded, or bic feet, which exactly corresponds with the the cargo heavy or light, an equal weight of water, pound for pound, will be displaced and caused to flow backward, out of the moveable secnal or level of the route, then shut the said gates, and after the fastenings of the moveable section shall be made loose, let the boatmen step on board. They will then be the preponderating weight, which, in the event of its be brought to co-incide with the lower Trunk,

movable section, be opened, and the Boat propelled forward; as it advances into the lower level, an equal weight of water will be displaced there,

pursue its appointed route.

has been propelled out of the moveable section, let the ascending Boat be propelled into it; by which means an equal weight of water will be displaced, out of the said section, and caused lower level. When the gates shall now be shut, let care be taken to cause the ascending boatmen lower trunk, and after the boatmen shall have have reached the top of the Lift, by means of a will have attained, or, at least, be steadily pur-suing their ascent, to their upper situation. It will then only remain to secure the safety fastenings, to connect the moveable section, with the upper trunk, to open the gates, and propel the Boat forward in pursuit of its destination.

In case of there being one or more ascend-

ing or descending boats, and no boat pursuing the opposite direction, as no water would be displaced, the weight of the boat that was wanting, would, at every operation be supplied by the water, that was not removed out, remaining in the moveable section. Should any difficulty occur in such cases on account of there being no boatmen ant as never to occasion the least detention. to step off or on, as a preponderating weight, the deficiency may be easily supplied by letting a sufportion from thence, instead of letting other water escape. Or should it be desirable, on any other account, to vary the operation, a crane and weight; a block and pulley; two or more racks and pinions, or some other mechanical apparatus may be adapted.

require two or more lifts to be constructed near charges for damages to the utmost amount possition to the preacher. I should have observed, that Elizabeth Decarrange their several positions to the best advantage; and, more especially, in such a manner, that between every two lifts there may be an intermediate section of canal, sufficiently long, wide and deep to receive, at least, one ascending and one and deep to receive, at least, one ascending and one descending boat, at the same time, and to let for the purpose. From the incalculable advanta-school." them pass each other with facility, otherwise, a ges that all such property holders would be cerseries of interruptions and delays that ought to be avoided would be certain to follow.

of ascending one lift, it is evident that to "float a board," as before stated, it will only be necessary route of the proposed canal being located as near term of the article from the United States, to attract to them as possible. They would be deeply intertiend to the hints contained in it. as often as shall be required to reach the top of the ested not only in furnishing, the few square inchlast and highest elevation, and after having passes of water that would be required, entirely sed across, to its other extremity, to descend lift clear of expense, but might invite an acceptance after lift, according to the manner of descent before described, to the lowest and last level at the bottom of the high ground over which a water conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may, in this manner, with facility, promptly into effect an object of the most general conveyance, may in this manner, with facility, promptly into effect an object of the most general conveyance, may in this manner, with facility, promptly into effect an object of the most general conveyance, may in this manner, with facility, promptly into effect an object of the most general conveyance. be accomplished.

original weight of water, probably, with the loss such that it will be entirely convenient for it to be of a little leakage, will be restored into the move-substantially embanked around to any exable section; and the descending Boat will also tent that may be desirable. Hence its posible placed in the required situation, ready to tion will be extremely favourable for securing it, in the most effectual manner against the In the mean time, should an ascending Boat be injuries of intense frost. Hence too, instead of a present,-immediately after the descending Boat great abundance of stone work of the most smith's beautiful poem is from the London Magadifficult and costly description, even of hewn stone, as is required in locks of the usual construction, clamped and bound together in the most origin from the circumstances of General Roto flow downward, through the open gates into the amounting, according to situations and circum-tract of the country surrounding Lissoy, or Austances, from eight to ten or twelve thousand dol-|burn; in consequence of which many families. to be on board, so that, their weight of water quarry stone, faithfully put together in a strong room for the intended improvements of what may also be expelled downward and shut out, together with that of the Boat and its cargo. The
moveable section is then to be detached from the
lower trunk, and after the boatmen shall have stepped off, upon the bank, by the time they shall ney that is usually expended, in the construction tant climes. of stone locks might with convenience be saved.—
Another circumstance highly favourable to the lish the seat of the poem; but there cannot dages, including the Boat and its cargo if any, adoption of the improvement under consideration remain a doubt in any unprejudiced mind, when is, its vast superiority in point of expedition, when the following are added, viz:—That the charac-compared with that of common locks. Wherever the should be such a declivity upon the route as to require a number of these locks in succession, no boat could ascend while others should continuous the interval of the willage preacher, the above-named theory (the brother of the poet) is copied from nature. He is described exactly as he lived; and his "modest mansion" as it existed. Burn, nue to descend; neither could any descend until or the name of the village-master, and the site others had ceased to ascend; whereas according of his school-house, and Catherine Girachty, a to the said improvement their alternate ascent lonely widow; and descent would be perfectly convenient, and The wretched matron, forced, in age for bread, preferable in every respect. Thus, there would To strip the brook, with mantling cresses spread; be a double portion of business accomplished in

Where the declivity shall prove so great as to be upon the alert, in swelling their respective charges for damages to the utmost amount possifrom Lissoy, the residence of the preacher. tain to derive in consequence of their having a water conveyance, immediately from their mills this plan, the advantages, to canal companies, in the original undertakers, must, from its very nature of its liable by law to be forfeited, and the pro-

LINSEED.

NOTICE TO DEALERS AND BUYERS.

THE COMMISSIONERS and TRUSTEES be accomplished.

Beside the immense saving of water that appears to be perfectly practicable in pursuance of fit and honor, which it is capable of securing to mination, either as to its age, or the country

The only Linseed which, by a law of the State, is permitted to be exported from RIGA, as sowbe depended on for producing a good crop.

Every Seller of Linseed or Hempseed in Scotland, is by Law obliged, under a penalty of not less than 50 Shillings per hogshead, to deliver along with it, to the Buyer, a Certificate, subscribed by him, mentioning the Quantity, the Price, the Port from whence the Seed was imported, the name of the Country where it grew, and the YEAR OF ITS GROWTH .- And the Buyers ought invariably to exact and keep those Certificates; because if they should afterwards find that they have been imposed upon in the easily prove the fraud, and obtain legal redress.

It is to be observed, that those who have rea-

son to believe they have got mixed Seed, or old Seed instead of New, are entitled to have the servants of the dealers, as well as other persons, examined upon oath as to those facts.

It is understood that an extraordinary practice prevails with respect to American Linseed; (and may sometimes be applied perhaps to other seed.) It is this: The barrels are branded, not with the year of the growth of the Seed, but with the year branding, know any thing of the age of the Seed, of character, as the proper evidence of that important fact.

In case of Linseed being damaged in the conveyance by sea, the importer may have it protected from seizure, provided that, immediately on landing it, he produces an affidavit by the master of the vessel, as to its having been damathe undersigned that it shall be crushed into oil

or exported.

The Surveyors are instructed to seize all bad, or damnified, or mixed Linseed, for whatever purpose imported, and to sue for the forfeiture dals, and a Committee of that Society have been and penalties, in terms of the Acts 13th George I. and 24th George II. And, after a seizure, no application or offer of security will be at all regarded by the Trustees, but the Surveyor will then sue for the forfeiture of the Seed.

BY ORDER OF THE TRUSTEE WILLIAM ARBUTHNOT,

The Law requires that all Linseed or Hempseed, whether of foreign or home growth, must be sold by the Linlithgow barley measure streaked; and such measure must be first marked and the Philadelphia Society for promoting Agricul-stamped by the Dean of Guild of some Royal ture, on Scott's legacy," and forwarded free of Burgh, with the usual mark of such burgh; and expense, through the post Office.

GOOD NEWS FOR MANUFACTURERS.

There is one provision in the Military Appropriation-bill, introduced at the suggestion, in the first instance of Mr. Eustis, which we understand will be of much importance to a meritorious class of People; we mean the Manufacturers of Woolens, who have little more capital than their looms. They cannot contract for large supplies : nor can they suddenly comply with large orders. An appropriation has therefore been introduced into the Bill, of seventy-five thousand dollars, for the purchase of Woolens for the Army, for the

prietor or Vender is also liable in a heavy pe-lyear 1823; so far as to allow the goods to be purchased of our own Manufacturers, and to allow intermediate time sufficient for the manufacture of them. It is predicted that we never shall does well' said he, 'but she who does not marry ing seed, is that produced in the immediate fire-ceding harvest, which must be exported in Casks, ed in the Manufactures of any other Country 'I am content to do well; let those do better whe branded with the year of its growth. It is re-than this. So be it. This is a sort of encourage-commended to the Flax Growers, therefore, to ment which will be of some service, not to Buy no Seed, unless they are quite satisfied that, overgrown and already pampered Capitalists, but it is new, sound, and unmixed, as such only can to the industrious Artizans who live by the labour of their hands .- Repos.

To PETER MINOR, Esq.

Sec'y Agricultural Society, of Albemarle,

FROM THE "CHAMPION"-LONDON.

RENT OF LAND.

RENT OF LAND is the difference or the value of the difference of the produce per acre of the worst land in cultivation, and of the better quality; when the same amount of capital has been expended, and the same quantity of labour Sir, From my first commencing as a farmer, I have has been bestowed upon each, in the same space of time.

RENT. 2. ARTIFICIAL KENT.

difference in the value of their produce per acre,

what is here called REAL RENT.

t

a

0

t

e

But in England, laws forbidding the importaforced into culture, and lands of better quality; restrictive laws: this higher rent, as being caused by the law, is called ARTIFICIAL RENT.

REAL RENT.

1. Is the fair equivalent to the landlord for the use of the land.

2. It would not be raised, and it would not be fowered, at the option of the parties concerned.

denominated principles.

4. It makes no part of the price of corn.

of corn, and the price at which it would be sold, were the trade in corn wholly free.

2. Corn is therefore, as effectually taxed by

to a quack medicine.*

3. Laws which forbid the importation of corn, under a certain price, into a country where the topulation is increasing, tend continually to in- ployments of capital and labour. crease the amount of rent paid her acre, and beget the necessity for other laws, raising the must conform. His rate of profit the cultivator of land this bar would continue not only while any land of the first quality remained uncultivated but until price still higher, and, ultimately, the total exclusion of foreign corn.

4. These laws do not, in the long run, benefit the profit of all. the farmer, on the contrary, they tend towards

his ruin.

The reasonings in this essay, although equally applicable to other kinds of farm produce, will be restricted to that of corn only, this be-

ing all that is requisite for elucidation.

For the purpose, too, of greater convenience in explaining the nature of what is here called REAL RENT, we will suppose a community to be placed upon an extensive portion of land of differ-ent degrees of fertility, but hitherto uncultiva-manufacture, or commerce. That this community consists of persons, who, by means of their capital and industry, are are farmers. Now, if this community were, as Republic are actually in. Those of the commu-

well as for the more easy explanation of the na- use among its members, or for exportation, ple willing to bring it into culture for the ordinature of rent, the subject has been divided into would be manufactured; while those who were ry rate of profit, as fast as the increase of the two parts, designated by the titles-1. Real farmers would erect farm buildings, and pro-population required it. No rent could therefore ceed to cultivate the land. In this state of so- be paid. If there were no restrictive laws, lands of a ciety (and it will be seen to hold good in every certain quality only would be cultivated, and the other state of society) there could be BUT ONE RATE OF PROFIT, on all ordinary employments as mentioned in the first paragraph, would be of capital and labour, for if any one branch of another, some of those who followed the less protion of corn have raised its price, and forced fitable branch would, in coure of time, leave it, worse and worse land into cultivation, and have and embark their capital in the more profitaalso greatly increased the difference in the value ble branch. This has always been, and must conof the produce between the worst land thus tinue to be, the course pursued; the most profitable concerns inducing people to embark in and as the whole difference is taken as rent, the them, the less profitable always inducing people and as the whole difference is taken as rent, the them, the less profitable always inducing people quality has been consumed, without fully satisfyfarmer has to pay a higher rent on all but the to quit them. But any one branch of industry can ling the demand, scarcity will ensue and the price worst sort of land than he would pay but for the only be more profitable than other branches, of corn, following the general law, will rise. while the produce of that particular branch is But as the expense of capital and labour on the insufficient to supply the demand, and consequently to raise the price of the article produced the farmer will increase as the price rises, and above its proper level. So, on the contrary, one branch of industry can only be less profitable on the ordinary employment of capital; and as than others, while the produce of that particular branch is more than sufficient to supply the 3. Its amount is regulated by circumstances demand, and consequently, to depress the price beyond their control. These circumstances are of the article produced below its proper level. In the first case, the price will rise in consequence of the scarcity; in the last case, it will ARTIFICIAL RENT.

1. Is a tax upon the consumer, levied upon the food he eats. Its amount is equal to the different to the food he eats. It is a food he can be a food h ference to which restrictive laws raise the price profit, the quantity of the articles produced will be lessened in the one branch and increased in the other branch; and so will the price of those articles be reduced in the one branch, and inmeans of restrictive laws, as it would be were creased in the other, and so will the profit be ina stamp affixed to every loaf of bread, as it is creased in the one and reduced in the other; and twenty-five bushels from land of the second rate thus the profit of every branch of industry will be equalized. It follows then, that there can be five bushels per acre—a diminution from the combut one rate of PROFIT on all the ordinary em-

same as that of the manufacturer, one law the increased demand had raised the price of all

In the case of the supposed community, it is clear that none but lands of the first rate quality only were produced by the same amount of capiwould be cultivated; the widest choice possible tal, and the same quantity of labour, as produced would exist, and the farmer would of course twenty-five bushels from land of the first rate choose the best land, and from the cultivation of this land he would obtain the common rate of profit, and no more, and for this rate of profit he as to enable the possessor of land of the second would be willing to continue to cultivate the soil, quality to obtain the common rate of profit from since it would be impossible for him to turn his cultivating his land, he would begin to cultivate

capable of supplying themselves with food, and first quality, the farmer must continue to culti-mand. It would be possible, however, in this most of the comforts and even elegancies of ci- vate the land himself. He would not let it, since stage, as it had previously been in the preceding vilized life. Some are handicrafts, and some no one would pay rent for it. Let it, however, stage, to produce more corn than could be conbe supposed, that some one could be found to they must necessarily do to establish a govern-take it at an annual rent, the consequence would with the common rate of profit, would reduce the ment—and if they were to vest the whole of the be, that as the produce of the land yielded only rate of profit to the grower below the common land in the government, to be sold for the pur- the usual profit of trade, whatever he paid he rate of profit, no more would be grown than was pose of producing a revenue to the state, it would must pay out of the profit, and consequently his absolutely necessary to supply the demand. be in precisely the same situation as some of the profit would be reduced below the ordinary rate newly settled states in the North American of profit by the whole amount he paid in rent, demand for corn had increased, and the price had Republic are actually in. Those of the commu- and he would thus voluntarily and unnecessarily been raised so as to enable those who held land of nity who are mechanics and traders would build have consented to make his capital the least pro- the second quality to obtain the common rate of nity who are mechanics and traders would build towns, where, whatever was necessary for suptowns, where, whatever was necessary for supsition is therefore absurd. So long as land of the frence of the produce between land of the first

But in order to shorten the present essay, as plying the wants of the community, either for mained uncultivated, there would always be peo-

This may be called the FIRST STAGE.

The SECOND STAGE may be said to commence when all the land of first rate quality had been industry were found to be more profitable than tinued increase of the people, the whole of its produce was not sufficient fully to satisfy the demand: recourse must then be had to land of a worse or second quality.

Let us 'inquire how this is brought about all the corn produced from land of the first rate best land will still remain as it was, the profits of will be raised temporarily above the rate of profit all the land of first rate quality has been brought into culture, no means exist by which the price can be lowered; and the increased profit will be-

long to the farmer, as long as he continues to be

the owner, as well as the cultivator of land. ‡ bushels could be produced, and if from an acre producing twenty-five bushels, nothing beyond the common rate of profit could be obtained, it follows, that if the same amount of capital, and the same quantity of labour would only produce quality, there would be a loss in cultivating it of mon rate of profit, and hence an effectual bar to the cultivation of land of the second quality. And necessarily governing the whole and equalizing the corn produced on the best land, as high as to afford the common rate of profit, on land of the second rate quality, from which twenty bushels

capital to better account by employing it in trade, it. This would not, however, reduce the price of corn, since no more land of the second quality So long as corn enough for the consumption of could be kept permanently in cultivation, than the community, could be raised from land of the was just sufficient to supply the increased desumed: but as this, unless it could be exported

> When, by the increase of the population, the been raised so as to enable those who held land of

^{*} In the case of a tax, the money goes to the Exchequer. In the case of the corn laws it goes at once into the pockets of the landowners. The whole community being injured for their advanare solelu.

[†] It is not pretended that it would be mathematically exact-but that there will be a continual approximation.

[‡] It may be presumed, that there could be no importation of corn until after all the land of first rate quality was in tiliage.

FROM A NEW YORK PAPER.

English words derived from other languages, which was formed some years ago upon careful examination of Johnson's folio Dictionary

SCIENS. Table of English words derived from other lan-

Teutonic	-	-	15		-
Arabic	-	*	13	Total, - 15,78	4

The incongruity which I find in this enumeration of dirivative words, is the misapprehension of the author of the dictionary or the compiler of this little table—thus he makes

The Saxon, German, and Teutonic, to be all different languages;

The Flemish and Dutch;

The Swedish, Gothic, and Teutonic;

The Irish, Erse, Scottish, Irish and Scotch; The Persic and Persian.

Some of these as they are here classed are cally the same language. The Persic and Perreally the same language. The Persic and Persian are no otherwise different than the usual provincialisms of every country; there is some difference between the modern German language of learned men, and the vernacular tongue; and that spoken in Saxony is considered more pure than in Swabia, or Bavaria; but it is still the same language: the same is true of the Irish and Erse, which is in every respect the same language, the only difference existing in the use of different synonyms in phraseology, instead of the same exact expressions on ordinary occasions; a circumstance common to the provincial dialects in every living language, and much distinguished in the Italian, which is considered to be spoken in greater or less purity in different parts of the same NOCENS. country.

TABLE OF CALCULATIONS,

Shewing the rate at which Cottons may be purchased in America, in order to be landed in Liverpool at a certain price; the principle on which they are made being founded upon actual results. It has been ascertained from experience intrade, that the charges on purchasing and shipping Cottons in America, generally amount to 121 per cent on Sea Islands and Uplands, and 15 per cent on Orleans.

Charleston Courier.

EXAMPLES.

Sea Islands and Uplands cost 121 cents. Add, loss in wt. 3 per cent.

TO THE EDITOR OF THE AMERICAN FARMER.

SKIM COULTER PLOUGH.

Oxford, Philadelphia Co. Penn. ? May 24, 1822. S

MR. EDITOR,

Sir-In your paper of the 17th you request information respecting the skim coulter used in England. The skim is a blade of iron attached to the common coulter, and standing at right angles with the broad side, a little below the surface of the ground when the plough is at work; or just so much as to pare off about 11 inches of the top of the ground before the share moves it. Its length should be about nine or ten inches or the breadth of the furrow slice. It is narrow and is almost brought to a point at the farthest end, but is made wider as it joins the coulter, and should be turned up into a curved wing, in order to turn over or shove into the furrow, every thing that it cuts up, which is covered over by the earth raised by the share. It is most in use in the counties of Kent, Surrey, Essex, Herts, and all those surrounding the metropolis. Its advantage is that it cuts up before the share, all grass, clover roots, weeds and rubbish, and turns them into the bottoms of the furrow, where they are more completely buried than if the furrow had been turned over at one slice. The grass is never seen afterwards to grow betwixt the seams of the furrows; and having the grass roots cut and separated from the earth before the furrow is turned, the harrowing is much easier, and the grain gets better covered. The skim coulter requires steady ploughmen and a slow motion of the plough, and does best with oxen. It answers best with wheel ploughs, which may be regulated to plough a certain depth, without depending so much on the skill of the holder; and this may be the reason why it has not travelled out of the southern counties, where the old 26 5.8 fashioned wheel plough, drawn by four or five horses, universally prevails, into the northern and eastern where the light swing plough with two horses is in use. I have seen the skim tried upon swing ploughs and given up; for these depending more upon the carefulness of the holder, a little variation in the depth of ploughing will throw the skim out of work; and I am doubtful whether an American ploughman would make them answer at miums should be adjudged to those persons, who rate of 3½ or 4 miles an hour, and turning over a should bring the best butter in quantities not less furrow of 12 inches. It appears to me that it

the furrow is seldom more than 8 inches wide, grow as they often do through a thin furrow.

ENGLISH PROSPERITY.

respondent Mr. Valck's letter, No. 8, page 62 consists. It consists of an enormous mass of you express some surprise at his talking of En-wealth in the possession, comparatively, of but glish prosperity, and ask in what it consists: few individuals, saved from the vast profits made out of the labour of this numerous population; sons on this side of thewater, for it has been who by the aid of the great improvements, which puzzling enough to people at home, amongst mechanical skill and invention have made for the whom it remains still problematical whether saving of labour, have been enabled to perform the nation be in an advancing, stationary, or declining state. But though Mr. V. has discovered the secret of this prosperity, yet as to what it consists of—as to what are its effects -whether it is a general national prosperity, or system, have been reduced to perform this addionly enjoyed by some particular favoured class or tional work for a lower rate of compensation, or classes of people, we are altogether left to con-what is not sufficient to command the same quanjecture. The secret, or the secret cause of the tity of subsistence, as when their labour was less prosperity of England according to Mr. V. lies in beneficial to their employers. her being able to export "not only her raw mate- vantages which has resulted from multiplying the rials, but also all her bread stuffs in the shape of productive powers of labour, by the employment manufactured goods" by means of her "numerous manufacturing population," which enables ed exclusively by the master manufacturers and manufacturing establishments, or even to a very her to consume "all the grain her soil produces, capitalists, and not the least has been permitted extended commerce, but more especially to the paper monied, and funding system of Europe. ple employed in any of the branches of trade, art, they were before these improvements began. And pearance of prosperity-of evanescent prosperity, For with those who are unacquainted with the only, but is applicable to every branch of industry the picture, and contemplate the misery and condition of the working manufacturers of Eng- in England. For the whole, or by far the greater wretchedness on the other side. land, it is difficult to conceive that there can be part of that surplus of produce which has been a people in any country under heaven, whose raised by the increased skill and industry of her labours are so incessant, and conducted with such working people, has always been applied either dexterity and skill, who are so sparingly com- to increase the numbers or augment the luxurious pensated as they are ;-or who suffer so many pri-enjoyments of those, who, from their situation in vations, and exhibit such a spectacle of squalid society, are enabled to exercise a complete conwretchedness. The prosperity then, does not con-trol over the labours of all the rest. ist in the comfort and happiness enjoyed by the Thus the wealth of England which looks so mass of working artizans and manufacturing peo-dazzling at a distance, and which many others ple. We may enquire next whether the farmers besides Mr. V. denominate prosperity, is an exand agriculturists enjoy any of this prosperity, in cess of affluence, arising from an inequitable disconsequence of the manufacturers eating up all tribution of the produce of the land and labour of transplanting them. their grain and beef? The thousands of petitions the country. And notwithstanding it has enabled filled with the numerous complaints of this class of the state in its external relations to assume a people, with which the tables of both houses of powerful and imposing aspect, it is nevertheless the legislature have been loaded for several years an enormous evil, which grievously afflicts the back, and which have been annually increasing, country, and which in the end must produce an inwill answer this question. Then the class of land-ternal decay. It is an evil which has arose princiholders? They indeed have enjoyed their share pally out of the manufacturing system, the direct of prosperity, but the fate of the tenants and culti-|tendency of which is to pauperize and enslave all vators of their property will be theirs next; and the lower population, and to make hundreds poor, even now it is fast overtaking them. For unoc-wretched, and dependant, for one to live in ease cupied farms produce no rent, and cultivate and affluence. But what has accelerated the prothem, themselves they cannot; for with their gress of this evil, and done more than any thing lands many of them already heavily mortgaged, else to increase and bring it to its height, is the they have neither money to stock them, nor paper and monied system of England; a system,

> I am sir, Your obedient servant. THOS. SMITH.

The Editor of the American Farmer, will confer a favour upon a subscriber of one of the low counties, by obtaining information on the subject of transplanting the different species of evergreens, viz. cedars, hollys, &c. he wishes to know precisely what seasons of the year, are best for

February, 26, 1822.

The gentleman who superintends the planting of the public square about the Capital at Washington (with whom we have not the benefit of an acquaintance) is qualified to give this information; we judge so from the invariable success which appears to have attended his tasteful operations on the grounds above mentioned.

Edit. Am. Far.

FOR THE AMERICAN FARMER.

Good fences, enclosing a rich soil, bearing heavy crops of grain and grass, for raising, sustainng and fattening, an improved herd of domestic ings, and implements of husbandry, constitute the pride, the glory, and the emoluments of

farming.

profitable farming, is herewith sent you, a des-Dey's or Bundy's. He intends to have one comcription of a machine to collect mud from mill pleted next week, for which the irons are now ponds, creeks, &c. with which to fertilize land casting. It is expected to do the work superior Common tobacco it is a cheap and a simple machine, and can be to the others, and with more expedition, while Seconds, \$1 to 6. made by almost any body.

square timber 25 or 30 feet long are laid upon the water at a parallel distance from each other of 8 or 10 feet. At each end of which a platform of plank is nailed on. At midway of this float, is erected a braced gallows, from the centre of the top piece of which, hangs a chain, or rope, JOHN S. SKINNER, Esq. holding in suspension a lever, or beam, at one bourer stands on one of the platforms—takes hold of the cross piece at the end of the beam, with both his hands-raises that end-and sinks the end having the shovel to it, into the mud below; then bears down the end which he has a hold on, which raises the end with the shovel and the mud is deposited on the other platform. Thus he will proceed until a load is collected, when the machine is pushed ashore and unloaded with a shovel. The quantity of mud that may be obtained in this way—by a single labourer—in a day, will vary with circumstances. I have obtained, where the mud was about 3 feet under water, 25 and 30 single horse cart loads.

By manuring, I obtained the last season eleven barrels and four bushels corn from the same land, that without the manure produced but two bara large quantity of produce from a small quantity of cure. In this climate, after they have been housed for two months they become a soft, sweet, rich substance, and make excellent puddings. In rich land they will grow to the size of a man's thigh. There are 6 or 8 varieties—all good. I think them far preferable as substantial food, to the famous Irish potato. They may be boiled, baked, roasted, steamed, and fried; and are a good substitute for bread, with flesh, fish, or fowl. Boiled, and then mixed with flour or meal they make excellent bread, if a plenty of good fresh butter is laid on, while hot. In fine, the lovers of good eating will find them a very desirable item in their catalogue of food:

8 to 12½ cts.—Pork, 6 to 9 cts.—Veal, per lb. 6 to 10 cts.—Mutton per lb. 6 to 8 cts.—Lard per lb. 12 cts.—Butter per lb. 31 to 37½ cts.—Cheese per lb. 12 cts.—Butter per lb. 30 to 350—Pine, do \$2 25 to \$3.—Tar, North Carolina, \$2 25—Rosin, \$2 25—White pine boards per M. \$10 to \$30—Bees' wax, per lb. 37½ to 40 cts.—Salt, Liverpool coarse per bushel 50 to 55 cts.—Turks Island, 65 to 70—G. Ridgeley, I was per bushel, 53 to 55.

Whaveland Tobacco.—2 hhds. of a very superior fine bright yellow, raised in Frederick countrior fine bright yellow. their catalogue of food:

Please to give in your paper some account of the best constructed kiln to burn rock into lime. Respectfully, &c.

J. S. SKINNER, Esq.

GEO, WILSON.

May, 1822.

As an auxiliary to a rich soil, the basis of all flax dresser, which he thinks will be superior to person who may wish to see them. Two pieces of the expense of a machine will not be over \$100. As soon as I have seen it in operation, which I at \$6 50 and \$8 50. am invited to do in a few days, I will advise you of particulars. If I am not deceived egregiously, it is one of the greatest improvements of the day. Burden is a practical mechanic, well versed in the construction of machinery, and a man of genius. He has recently constructed cast-iron water wheels of large diameter, and ten feet buckets, which are highly extolled by those who use them: he has also made great improvements in the machinery of horse ferry

A FARM FOR SALE.

The subscriber offers for sale the FARM, whereon he resides, called MORVEN, situate on Elkridge, sixteen miles from Baltimore. It contains about 636 acres, the most of which is prime plaster land-a considerable part in good cultivation, and nearly the whole in good heart. The soil is well suited to tobacco, corn, wheat, and other grain, as also grazing, to which indeed it is uncommonly well adapted. It has about 25 acres of first rate meadow land, lying on a stream called Elkhorn running through it, and which is now chiefly down in timothy. The farm also binds a considerable distance on a branch of the Patuxent, and is bordered to that extent by rich meadow land, which although subject to overflow, could easily be rendered valuable grazing ground. The character of this farm is well known in its neighbourhood, and the proprietor thinks he may confidently say it ranks among the best on the Ridge, at least as regards the natural qualities of its soil, and susceptibility of improvement-he also feels warranted in stating, that its actual condition (the effect of a course of several years improvement,) will be found such as would render immediate and handsome returns to a farmer of capital.

THE DWELLING HOUSE is large and comfortayears received extensive repairs, and an addition at considerable expense-most of the outhouses are also in good condition, and these include a dairy, with a fine spring of water, good quarters for the labourers, corn and meat houses, ice house, &c. On the premises is a spacious garden with a variety of the best fruit, and two ap-

AGRICULTURE.

MONTGOMERY COUNTY AGRICULTU-RAL SOCIETY.

Rockville, May 15th, 1822.

J. S. SKINNER, Esq.

Sir: The following resolution was adopted by the Agricultural Society of Montgomery county, Maryland, at its last semi-annual meeting on the 9th March, 1822.

" Resolved unanimously, That the thanks, of

"the 'Rockville True American."

Agreeably to the view of the Society in this to be published.

"Resolved unanimously, That it is the opin-"ion of this Society that 'the American Far-"mer,' Edited by J. S. Skinner, Esq. is eminently " calculated to promote improvements in Agricul-"ture, and rural economy, and that it merits the "patronage of every friend to such improve-

ments.

Some delay has occurred in the transmission of the copy of the address before mentioned.

I am, Sir, Very respectfully, Yours, &c. &c.

Z. MAGRUDER. Recording Secretary of the M. Ag. So.

ADDRESS

Delivered before the Agricultural Society of Montgomery County, by Mr. ARCHIBALD LEE, on the 8th March, 1822.

opportunity of congratulating you, my fellow citiwith the usual liberality that characterises our fellow citizens.

After the able address of our friend, F. S. Key, cate excited in all his hearers. I have to regret, that this duty did not devolve on one more competent to its performance. Honored by your gence, to such remarks as I have had time to pre-

pare for the occasion.

The disinclination to enter into agricultural societies, would appear to exist in this quarter of the Union, to a degree unknown elsewhere.

This supineness, this miserable apathy, and indulgence of undue prejudices, on subjects so intimately connected with our best interests, is to say the least, a fatal proof of the entire ignovarious kinds of grain, the invention and adoption of the objects, as well as the advantages of these institutions. When we turn our attention to the promotion of husbandry, and a growing attention to the promotion of head of the promotion of t tion to our sister states, we find the most distinguished citizens not only taking part in, but most degree, from stitutions which concentrate the prominent in superintending, in patronising, in enfruits of experience, which apply the discoveries fruits of experience, which apply the discoveries are which apply the d cite into activity, all the generous principles of emulation, and all the latent powers of improvement." cautions; and in a condensed population, such as some of the Eastern states afford, it may become problematical, whether more strength is not retained, by this mode of disposing of any This passage is in itself a volume for you to excess they may have, than by allowing it to reflect upon. We must not say that our soils emigrate to a distant quarter in search of agriculturaised her to a commanding rank amongst the are too poor, too much exhausted, that we have rail occupation: but in our state no such question not the means possessed elsewhere. The councan arise; we unfortunately have much unoccupied land, and are deplorably deficient in rural eco-

This country, my friends, holds a high rank in nently useful and valuable individual, does the improvements and inventions that experience approves. To Mr. Thomas Moore, the union is indebted for an excellent treatise on farming, in which the superior merits of deep ploughing are set forth in language simple and impressive. Davis, Warfield, Brown, and several others have inulation, but above all, as he has frequently de-vented, and furnished ploughs equal to any used at cheap and probably as durable a plan as any extant. One individual has erected more than four Agricultural Societies collect information with miles of this valuable enclosure with his own serplus for market. Our tobaccoes are unrivalled in ment of a country. Mr. Madison, the early as. Agriculture, commerce, and manufactures are quality; our grain districts supply excellent bread,

water. Our local situation is certainly commanding, being upon the direct line between the seat of government and the western world. In fine, we possess within ourselves all the means, if judiciously exerted and applied, to convert this county into a fertile, a picturesque, and a most desirable abode. Allow me before we part, to turn your attention to the subject of premiums, and to offer reasons that are apparent; yet the primary obfor your consideration, the ideas that have occur-ject should be the general tystem of farming and red to me as important in their distribution. Upon the judicious selection of the objects that are to receive encouragement, will in a great degree, depend the success and the utility of this institu-

h

of

e

T

t

tion to the community. The plough must be admitted on all hands, to be the most important implement of husbandry; it therefore claims your first attention. The harrow ranks next. In tenacious soils, the hoe was wont to be preferred by those who cultivated tobaccoes and indian corn; and in sandy soils it is still highly esteemed; but for all the essential purposes of a farm, experience proves that there are three necessary implements in tillage, viz: the plough, the shovel plough or cultivator, and the and the rake, and still many degrees inferior. On the preparation of the soil, the value of its product mainly depends. Consequently those implements best adapted to that object, merit our primary consideration. As the spade and the rake enable us to prepare our gardens to the greatest farms, that approach nearest to them, must of consequence prove most important to the farmer. being perfect, we must all acknowledge; how many degrees less perfect, our farming implements are; will be apparent to every one, who contrasts the relative quantities produced by these several cultivators, the disparity in the profits being inconceivably great. After the grain, used in giving us the staff of life; the plough, the harrow and the hoe, are then the fairest objects for premiums: next to the implements with which to put them in motion. In some countries, horses in others oxen, are the favourite force applied to the draft: and one of the most polished nations, in many districts depend upon the cow for this essential duty. With us, the horse, the ox, and purpose. These then are the next fairest objects for premiums. Next in order come all those ani-These then are the next fairest objects mals useful to feed or clothe man-as the sheep, the hog, &c. The cow is after all perhaps the draft; and in some countries her hide is used to clothe man. In due order follows household manufactures; with which I would be disposed to unite the most useful and substantial of the do-mestic manufactures. It is certainly important that the mode of bringing these various objects into fair competition, should receive our attention. Without meaning to innovate upon usual, and I fear establisehd customs, I beg leave to add, that observation and experience point out the propriety of extending the field, to farms, to stocks of cattle, and to the general practices and management of the farmer, in the various seasons of the year. The injurious consequences that flow from the appropriation of all your premiums, to individual tend to obstruct the current of improvements. It

As it is necessary to improve our stock animals we must give to that object a portion of patronage; but it should be minor to the improvement of an ject should be the general tystem of farming and of the farm: that farmer who can shew the best kept, and most highly improved stock of horses, cows, sheep and hogs; a well cultivated farm in and economy in his management of his soils; and the largest quantity of manures to invigorate, and

in the rural economy of a country. These being in the rural economy of a country. These being saving machinery, to the details of industry; more in the province of females, are too frequent-thus facilitating the work of civilization and reharrow. These are all substitutes for the spade comforts, and often become sources of profit -Good fruits, vegetables, poultry, cheese, butter and milk, are by no means secondary considerations in a well regulated family: cheeses in many countries, a substitute for meats. It was foradvantage, so the implements used upon our an article of profit, and a beverage in which we That even the garden implements are far from country. Household manufactures, are imporare altogether used-in some, mules are preferred, tures, that will in beauty, neatness and excellence Thus do we secure the double advantage of sa-ving our capital, and enlarging our stock of in-to every field, and afford an immeasureable supply to every demand for internal improvement. the mule are all made subservient to this great that portion of our population, and retain them for the purposes of labour, called for by our mixed husbandry.

I have already trespassed too long upon your attention; the deep interest created by the submost important—she gives milk, butter, cheese, ject, which encreased as I progressed, must form meat; she is converted into all the purposes of my apology. my apology.

The lution accompanying this report. tranquilized state of Europe; the establishment of what appears to be a more settled order of things; the general competition in every branch This noble river, from its peculiar course, hold- and fall of its water, and in every respect is things; the general competition in every branch of trade, appear more decisively at this time, than at any former period, to throw the several states of our union back upon their own resources, and, of necessity, todrive them to the contemplation of their intrinsic energies. The period is rapidly approaching, at which it is conceived a large manufacturing interest will be fostered in our country, and the attention of our population approaching, and the attention of our population approaching a respectively through the confines of more propitious to navigation. Within forty or the state; watering an extensive and fertile refitty miles of the fide, it passes through a range of country which falls with great abruptness to the Streams of our country, among the rest the Shenandoah, whose protracted channel sweeps through the most luxuriant valley in Virginia, must river, offer almost the only serious obstacles always be considered one of the richest possessions of our state, and eminently entitled to the offer of the state of New York. Some late efforts country, and the attention of our population ap-plied to furnish a substitute for a vast variety of the lapse of many years, must become the pro-duct of our own labour and the growth of our own soil. This consequence has been partially benefits of a commerce longing to seek that chan-must be productive of incalculable benefit to developed at the present day, by the entire thange of our political relations with the states of any river in the United States, of an immense extent of country, reaching of Europe, and it is believed that so far as rewhere an ascending navigation is attempted, and through the heart of Pennsylvania and penetraof Europe, and it is believed that so far as regards the condition of this continent, that posture of things will be permanent. From this view, it is obvious, that the labor of our country must be differently applied, and the current of our national means turned into new channels.

Your committee beg leave further to say, that in their opinion it is impossible to give a more profitable direction to the policy of the governinternal improvement. A judicious effort in this way is always sure to produce a rich harvest of remuneration, and it is believed, that every expenditure required by it, is completely reimbursed to the country, almost before its deficiency is felt. There is scarcely a turnpike road constructed, or a canal made, which does not, in the course of a very few years, yield to the community, however unprofitable it may be to individuals, a full recompence for its creation; and indeed from the facilities which the state of Maryland every where presents to this species of enterprise, and the increasing trade that must inevitably be the consequence, your committee do not hazard too much by declaring, that a well selected scheme for the improvement of the means of internal transportation, must become one of the most profitable objects in which capital could be invested.

by the house, your committee conceive it necessary that they should present a general view of

All of which is respectfully submitted.

JOHN P. KENNEDY Chair, of the Com. House of Delegates, Feb. 11, 1822.

REPORT.

RESOLUTIONS, No. 1.

Resolved, That the governor and council be authorised and empowered, to take such measures in regard to the appointment of the time and place of meeting, and the adjustment of other preliminaries attendant upon the execution of the duties assigned to the commissioners appointed in virtue of the act passed last session, for the examination of the navigation of the Potomac, conjointly with the commissioners appointed by the executive of Virginia, as they in their judgment shall deem most conducive to the prompt and wholesome execution of the said act.

Further Resolved, That the governor and council be authorised to draw upon the treasurer of the western shore for any sum of money which may be necessary to defray any reasonable and necessary charges growing out of the said com-

And Further resolved, That the governor be requested to apprize the executive of Virginia, of the wish of this state, that the said commission should proceed to discharge the duties assigned

RESOLUTIONS, No .2.

Such appear to be the general topics within nine of the most discreet and intelligent citizens of Internal improvement, in relation either to the whole of the state, or such parts thereof as they

Further resolved, That to each person selectrected to transmit a copy of the reports on inter-

To this effect your committee have the honour opresent the resolutions accompanying this reof country, as they shall in their judgments deem necessary to the illustration of the subjects of Internal Improvement, and that for the expenses of the same they be authorised to draw upon

the treasurer of the western shore.

FROM THE (LONDON) FARMERS' JOURNAL.

ON SOWING WHEAT AND BEANS AL-TERNATELY.

Eastwood Farm, near Rotherham, Sept. 29, 1821.

SIR.

On reading The Farmers' Journal of the 27th August, I noticed that a correspondent had called your attention to the practice of sowing wheat and beans, which you there said was getting into use in Yorkshire. By your last Journal, which I have received to-day, I perceive your correspondent is a Mr. Rhodes, who does not appear to give you all the information you wish to have. You may get whatever you wish from any of the farmers in the neighbourhood of Sittingbourn, Kent, where it is the common practice. I have followed that system fourteen or fifteen years, and introduced it into Yorkshire four years ago; therefore I feel it my duty to give you the following particulars. At the same time I also feel it my duty to caution those who are so burdened with parish rates, and other expenses, as to be losing their property rapidly, not to depend on this or any other system which they have not tried—but to give up such land while he can pay every one his due. But to those who are in a difthese resolutions as it can conveniently be done, which they have regularly summer fallowed after several broadcast crops, I can recommend this the range of the enquiry submitted to your com- of this state, as a committee for the purpose of plan, being confident that the land will produce mittee. They have endeavoured to convey a reporting to the executive, either collectively or more and better crops without being injured: and as landlords are interested in their tenants' prosperity, if it can be proved that the land will produce more to the tenant, without being injur-ed by this or any other system, surely all those andlords who have bound their tenants to summer fallow, or any thing else which is injurious, will not only set them at liberty, but assist them in introducing a better mode.

I once recommended this system (when it might have been of some use, had it been generally practised,) which you will see if you turn to your Journal of February 24th, 1812. I was the writer of the letter signed J. S. T. "On increasing the growth of Wheat." My desire was to benefit both farmers and the communiwhich was then selling as high as 130s. per quarter, as you will perceive by that paper. I feel quantity of the soil for the wheat to take root in, sorry the words plough flat were left out, after and the bottom being well ploughed up, leaves a Kent, in that letter. It ought to read thus: surface covered with small clods, which is useful "It is the practice in most counties to plough to the wheat in the winter and spring, and which the land into ridges, for all kinds of corn, and to prevents the land running together, as is often

of corn since has not paid. The following is the tity and quality. About half of the other grows man to lift with ease.

The broad-sharcings and dressings were repeated where necessary: the season being favourable, part of the land was limed the last dressing, and the whole left well water-furrowed (the land being strong and inclined to wet.) till the latter end of January or beginning of February, when as much of the remainder was manured as my stock would permit, which was carted on when the land was frozen so as to bear the carts: as soon afterwards as possible it was mon plough; and the land may be worked to a simple, but expeditious. I then turn my sheep inple, but expeditious. I then turn the carts: as soon afterwards as possible it was mon plough; and the land may be worked to a advantage.

I am Sir, Your obedient servant, THOS. WRIGHT.

sun;) the beans were horse-hoed three times, and brother-in-law of Mr. Champion, the breeder of method to be adopted in such cases that I know hand-hoed twice, and well earthed up with a the fine stock lately imported by the Editor of of, is, for the shearer to clip the ends before the plate fixed to the horse-hoe the last time. The this paper, and sold to Col. Lloyd. Mr. Wright sheep is shorn.

THE FARMER... No. I.

Sheep.-Since the manufacture of cloth has become an object of primary importance, any attempt to improve its quality, and of course, its value, cannot but receive the cordial assent, the land into ridges, for all kinds of corn, and to sow beans broadcast, and in the county of Kent to plough flat, and drill beans." In other respects it gives a tolerably plain account of the plans I have pursued up to the present time.

In July 1817, I removed from the 1sle of Shepland been summer fallowed.

In July 1817, I removed from the 1sle of Shepland been summer fallowed. In July 1817, I removed from the Isle of Sheppy, to this place, and as soon as possible put in
practice the plan I had before recommended. I
found the farm full of twitch (or couch,) coltsfoot, docks, and other weeds although it had
foot, docks, and other weeds although it had been summer fallowed; in the way I have before
been regularly summer fallowed; in about eighlevel of the farm has been kept
than in the strong partiality for cloths of a foreigh fabric. In order to manufacture cloth in
this country, that will successfully compete
described: ever since, my farm has been kept
with foreign fabrics, nothing is more wanting
the foreign fabrics to the preliminary steps than requisite attention to the preliminary steps

As the season for washing and shearing sheep way I cleaned and cropped it: immediately after beans, one fourth clover, and the remainder poharvest I set a sufficient number of light turn-wrest ploughs, (I mean considerably lighter, and of more simple construction, than the common Kent plough, though called Kent ploughs here, and considered heavy) to work, but without the same purpose, and always wrests (or mould-boards) or coulters with shares cart out manure upon mould or covering of reaching and shearing sheep has now arrived, and as the quality and value of the cloth depends much upon the manner in which I use a considerably lighter, and of the cloth depends much upon the manner in which these are accomplished, permit me to recommend to the farmers of Windsor County, ty and quality of my manure. I also grow turn-ty and considered heavy) to work, but without the same purpose, and always wrests (or mould-boards) or coulters with shares cart out manure upon mould or covering of reaching the practice I have adopted and pursued for a series of years. Experience testifies to its superior excellence. I take a horshead tub or wrests (or mould-boards) or coulters, with shares cart out manure upon mould or scrapings of roads perior excellence. I take a hogshead, tub or from 12 to 27 inches broad, according to the strength and state of the land as to weeds, always taking care that the shares worked under all the original to the strength and state of the land as to weeds, always taking care that the shares worked under all the original to the land as to weeds, always taking care that the shares worked under all the original to the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and state of the land as to weeds, always to wash the strength and th roots of twitch, by which means the land was completely broken and the roots raised so near the top as to be got out by scarifiers and harrows; but my favourite implement for that purpose is what is called a shake drag in Notting-hamshire. It is a strong harrow with fixed handles, and teeth projecting forward, so as to work the land effectually, but not too heavy for a sufficient depth, the earth raised and broken mean to lift with ease. without turning up a stiff bottom (which is gener-ness of cotton. This process is not only sim-

ploughed with a turn-wrest plough (with wrests) greater depth, and more effectually destroys which when well done turn the manure quite under, coltsfoot, thistles, and other weeds, than scarited to it. The shearer should be extremely fiers.

I fear I have extended this to too great a strength exhausted by evaporation. My beans, length; if so, cut it down as much as you think length; if so, cut it down as should keep the shep in such a position, that the skin may be smooth, and thus enable him to cut the wool close and even. It may always be observed, that the extremities of the wool of yearling sheep that have never been shorn, are The intelligent writer of the above is the much coarser than towards the body. The best

AMUSEMENTS OF THE TURF.

To the Editor-Sir, I have always been of opinion that nothing would so much contribute to preserve for us a fine race of Horses, as the keeping up on a respectable footing, the amusements of the turf. They have been lately revived under the most promising circumstances in New Vork presided over and regulated by gentlemen of the highest respectability in that state. There was some talk here lately about following their example, amongst gentlemen who are alone able and capable of taking the lead on such occasions, and I hope it will not be abandoned. Some object, on the score of the gambling and dissipation which ensues, but it is not fair to argue from the rational use to the abuse of things, else we might with equal justice decry every species of the rational part of the rational use to the abuse of things, else we might with equal justice decry every species of the study of the rational use to the abuse of things, else we might with equal justice decry every species of the study of the rational part of full seventeen hands; a form, it may be averted the rational use to the abuse of things, else we might with equal justice decry every species of the study of the rational part of the height of full seventeen hands; a form, it may be averted that the rational use to the abuse of things, else we might with equal justice decry every species of the study of the rational part of the horses, whether for racing, or of full seventeen hands; a form, it may be averted the rational use to the abuse of things, else we might with equal justice decry every species of the study of the rational part of the horses, whether for racing, or of full seventeen hands; a form, it may be averted the rational use to the abuse of things, else we might with equal justice decry every species of the study of the horses, whether for racing, or of full seventeen hands; a form, it may be averted to the rational use to the abuse of the horses, whether for racing, or of full seventeen hands; a form, it may be averted to the horses, and the horses are the horses and the horses are the horses are the horses and the horses are the amusement and recreation whatever. On that principle we had better all turn hermits at once, and seeking gloomy caverns and clear springs, live on blackberries and cold water for fear of being contaminated by the vices of society or enervated by the luxuries of civilization! It is only requisite that the thing should be taken in hand by gentlemen who have leisure and taste, and be sanctioned by the name of some one long known, and every where respected for the urbanity of his manners, his hospitality and high character as a fair and liberal sportsman,* and success would be the sure and speedy result; we should have thousands coming from every quarter to spend their superfluous money in our neighborhood, and how much better would that be than sucking your paws and moping and growling about hard times, like surly bears. What put it into my head to send you this scrawl, was reading in the London Sporting Magazine of April last, the following

COMPARISON

Of the NUMBER of RACES, and AMOUNT of SUMS WON at NEWMARKET: of the NUMBER of RACE courses, and of covering stallions, advertised between 1779 and 1819: REMARKS on the late TROTTING MATCHES.

To the Editor of the Shorting Magazine. SIR,

Says the author of the "Philosopical and Practical Treatise on Horses," published in 1796, in the chapter "On Running Horses,"—"The sage lucrubations of our closet jockeys, which occasionally make their appearance in the daily prints, are in the following strain :- 'When the turf has sunk into that contempt it merits, we shall again have that race of strong boney horses to which our forefathers were accustomed; the old English hunter will again rear his crest.'-Precisely so, in part, it would no doubt be; and we should again jog on after the sober rate of half a dozen miles per hour, upon that marble-breasted sort, which old Bracken dignified with the name of "pioneer horses;" and again might we make a long day of travelling fifty miles in a stage coach. So much for the strong boney horses of our grandsires. Respecting the old English hunter, so highly in favour of these reforming jockeys he was always a half-bred horse, and how would they contrive to make such an one, without the help of racing blood? With paragraphs of the above tendency, may be classed those congenial ones, which, at least during every unfortunate period of war and distress, announce the decline of the turf, and forbode with exultation its approaching ruin. It was nothing uncommon in known. regular and authentic prophesying times, for two prophets, equally well bred, to predict clean contrary things; and I will be bold to foretell the IN-

GREASE, instead of the decline, of horse-racing, extremes both of short an long races, seem to Never were so many bred stallions kept in England, as at present : never was Newmarket beter attended, than at the late meetings.

Let us see how correctly this last soothsayer has wo dates 1779 and 1819, of which, his date 1796

Race courses in England, 1779, eighty-five-in Scotland two-in Ireland, thirteen.

being annually held between March and November on the Curragh of Kildare. In 1779, only four meetings on the Curragh.

Number in 1820, ninety-four, among which there appear no foreign horses.

The observations which naturally occur are as follows: in the first place, the prophet who fore- trot. That is to say, told the increase, vice the decline of horse raing, comes in first and first, beating the whole field of his prophetic brethren in a canter. The

have been abandoned. We seldom or never, at present, hear of quarter or half-mile matches, and those of six or seven miles, had been out of vogue long before the earliest of the two periods prophesied, by a Newmarket comparison of the specified. Even racers over the B. C. or R. C. at Newmarket, or indeed four-mile races any s not, indeed, quite a medium-a circumstance where, now seldom occur, comparatively with of no great importance, presuming, however, the custom, of 1779, and the earlier periods.—that, in essentials, the period between 1769, and The late Sir C. Bunbury was materially instru-1789, was one of the most flourishing ever known mental in the introduction of short races, for in England or Europe, including France, which which he had, probably, various motives. This can be named, either before or since; and in no perhaps may be connected with the late custom particular to a greater degree, than in the high of breeding large leggy horses up to the height rel, Bay Malton, Eclipse, Goldfinder, Bellario, more solid motive in any view than breeding Pumpkin, Mambrino, Mark Antony, Gimcrack, useful horses, and such as will serve as stallions Shark, Masquerade, the Rocket Gelding, Magog, for other purposes beside that of the turf; and Woodpecker, Potatoes, Imperator, King Fer- more especially on account of the uncertainty of gus, Rockingham, Phenomenon, Sir Peter,-althe stud, the best racers, full often, proving of no list, whether as racers or stallions, it would not use whatever in getting racing stock; and further be easy to match at any other period.

Newmarket Craven Meeting, March 22, 1779; sixteen hands at most, may include, and perhaps, on the consideration that fifteen hands one half, or Stakes won by Woodpecker, 16 starting-four with greater certainty, every desired quality of sweepstakes, in amount 860gs.; three matches, speed, stoutness, or of ability to carry weight, as has indeeed been exemplified in the list already Newmarket Craven Meeting, April 12 to 17, given. Hence perhaps, the sod of the B. C. 1819: Won by Cannon Ball, 20 starting-twenty-might, with real use, be more trodden than of two sweepstakes, 13,990gs.; two fifties, and 13 late years it has been. It must nevertheless be matches, 3010gs.—The whole, 17,000gs. matches, 3010gs.—The whole, 17,000gs. impartially stated, that during the latter period, First Spring Meeting, April 5, 1779: Sixteen the character of the British thorough bred horse weepstakes, 8675 guineas; five plates, 350gs.; has continued to rise upon the continent and in

From the generally large size of racers, give First Spring Meeting, April 26, 1819: Four- and take plates have been long since almost exrism even among our true and high bred Second Spring Meeting, April 26, 1779; To-sportsmen; but of the low bred kind or leather-plate jockies, within memory of the pre-Second Spring Meeting, May 10, 1819: Total sent writer, it was most abominably savage, the riders cutting out their competitors' eyes, or Total of money won in the three Spring Meet-knocking out their teeth with their whip handles! It is to be taken for granted that crossing is abolished, since in a match the old appendage.

which it was conversant in health.

tion when in health.

A lady in New-England, of a respectable family, was for a considerable period subject to paroxysms of delirium. These paroxysms came on instantaneously, and after continuing an indefinite time, went off as suddenly, leaving her when she was engaged in rational and interesting conversation, the would stop short in the midst of it, and become in a moment entirely deother subject, not having the remotest connex- riment, that the compost is a more useful dision with the preceding one, nor would she advert to that during her delirium. When she became rational again, she would pursue the same conversation in which she had been engaged during the lucid interval, beginning where she had left off .- To such a degree was this carried, that she would complete an unfinished story, or sentence, or word. When her next delirious paroxysin came on, she would continue the conversation which she had been pursuing in her preceding paroxysm; so that she appeared as a person might be supposed to be who had two souls, each occasionally dormant, and occasionally active, and utterly ignorant of what the other was doing.

FROM THE DEMOCRATIC PRESS.

SOAP SUDS A MANURE.

A few years ago my attention was attracted by the soil of my garden, reduced to a state all its future produce, influenced my wishes for its restoration. An invigorating manure was nesuccedanea within my reach, had the greatest probable appearance of succeeding, it occurred, that possibly some trivial advantage might be derived from the oil and alkali suspended in the waters of a washing. Pits were immediately ordered to be made, and in them, the contents great success; but he has applied it awkwardof a tub, which my servant usually committed by and wastefully. He directs it to be poured to the common sewer, were carefully deposited; from a ladder out of a watering pot over both a small portion excepted, has in this manner tom. Mr. Speechley is not the first person who prived of the blood, which answers all the purbeen watered and enriched; that small portion has thought of this application of the mixture. poses of crimping; for it is owing to the coaguremains a visible demonstration of the utility of It is a fact which has been long known and lated blood remaining in the fish, with the other this manure. ter of York. In this simple fluid manure, we this must be considered as a vluable manure, as have an animal oil, and the same alkali, but it can be obtained easily, at small expense, and a respectable family in New York, some years neither of them, perhaps, in so pure a state as in large quantities; and when its nature is well ago undertook a piece of fine needle work. She in the manure, with the addition of fresh understood, will probably be no less esteemed, devoted her time to it almost constantly, for a horse dung. The fresh horse dung is added in by the farmer than horse dung.—To the gardennumber of days. Before she had accomplished it, she became suddenly delirious. In this state, without experiencing any abatement of her dis- to make the compost fit for use. All, however, may be applied to his fruit walls as a wash fatal ease, she continued for about seven years, when that seems to be gained by the horse dung, is to the noxious brood of predatory insects. her reason was suddenly restored. One of the the animal oil, which may be united by the alfirst questions she asked after her reason return-ed, related to her needle-work. It is a remark-able fact, that during the long continuance of her delirium, she said nothing, so far as was recollected, about her needle-work, nor concerning supply of vegetable matter. If we make the nerally. In addition to the applications of oil, any such subjects as usually occupied her attended on strictly accurate on the other side, pointed out by Mr. Falconer, I have used it with must be an increased quantity of animal matter vines from the bugs which are detrimental to in the water, after it has been used for the purthem. I also think that water and muskmellon pose of washing linen.

vantage of the application of the oil and alkali it are not sufficiently known. Future experiments mind perfectly rational. It often happened that only, as a manure, and perhaps the delay of 6 I am disposed to believe will stamp a value on it when she was engaged in rational and interest-months in preparing the compost would not be far beyond what we at present conceive or anticompensated by any superior efficacy, that may cipate. be expected to arise from the combination of lirious, and commence a conversation on some the horse dung. It also appears from the expecovery than Dr. Hunter himself could justly infer from his own limited experience of its ef-

2. This mixture of an oil and an alkali has been more generally known than adopted, as a remedy against the insects which infest wall fruit trees. It will destroy the insects which have already formed their nests and bred amongst their leaves. When used in the early part of the year, it seems to prevent the insects from settling upon them; but whether by rendering the surface of the leaf disagreeable to the bodies of the animals, and thus repelling them, or neutralizing the acid they deposit, and thus preventing the leaf from contracting into a necessary form for their reception, I cannot presume to determine.—One of the modes by which this mixture indirectly contributes to the fertility of the ground, may be by its destruction of the insects, which prey upon the plants. It is also, I think, to be preferred to the lime water, as the wood ashes and lime, which Mr. For-syth recommends to be used for the removal of bit of feeding their horses on cut rye straw and of poverty unfriendly to vegetation.-Interest in insects. It is preferable to the lime water and meal, say they seldom die of the botts. the lime, because lime loses its causticity, and with that its efficacy, by exposure to air, and known as the first horse keeper in the state, ascessary; but such a stimulus could not easily must consequently be frequently applied; and to be procured.—While considering which of the succedanea within my reach, had the greatest wood ashes and lime, because the same effect is urine, and after some time giving a strong purgaproduced by the mixture without the same la-tive. bour, and is obtained without expense.

as washing succeeded washing, other pits trees and wall, beginning at the top of the vale, are to have their entrails and gills extracted, and were dug and filled, so that the whole garden, and bringing it on in courses from top to botten packed in ice, in which state they are de-

Remarks of a Countryman.

The discovery of Soap Suds as a manure, is worthy of the consideration of agriculturists gewe may observe, that in the fluid manure there some success in the preservation of cucumber ose of washing linen.

The experiment then shews what is the adtimely application of Suds. The advantages of

A COUNTRYMAN.

FROM THE RALEIGH REGISTER.

In your last paper I saw a cure for the Botts, or as they are commonly called the Grubs, in Horses. It may be very correct; but having learnt from the late Mr Craven, of this city, a much more simple, and perhaps as effectual a cure, I offer it for publication. He stated, that on a visit to Edenton, he could not procure for his horse any other food than cut oats. The horse having been ac customed to be fed on corn and fodder, he feared that he would not be able to support himself on cut oats. A few days after he arrived, the hostler requested him to go to the stable. When there, he found his horse had passed a large quantity of grub worms, and every day while he stayed, he continued to pass them in a reduced quantity, so that he believed that his horse was preserved by this excellent food.

POOR RICHARD.

The late Austin Curtis, of Halifax, who was

FISH.

The Philadelphians have adopted the mode of despatching vessels to the Capes of the Delaware, for the purpose of procuring fish, which parts, which deprives them of that sweetness and

Mr. Humphrey Tuckwell, of Signett, Oxfordshire, a piece of plate value £15, for the best ram of the Cotswold (or long-wooled) breed.

Mr. Stephen Grantham, of Stoneham, Sussex, a piece of plate value £15, for the best pen of Southdown Ewes.

For three pens of Merino ewe tegs, belonging respectively to the Marquis of Londonderry, John Fane, Esq., and C. C. Western, Esq., an honorary premium of £10 each.

Mr. George Dodd, of Chenies, Bucks, a ditto,

Mr. John Putland, a ditto, for ditto.

Mr. Stephen Grantham, a ditto, for ditto. Mr. Stephen Grantham, a piece of plate value £10, for exhibiting the best breeding sow, of his peculiar breed.

Charles C. western, Esq. a ditto, for ditto.

Mr. George Dodd, a ditto, for ditto. Mr. Wm. Cawston, of Broadwater, Herts, a ditto for ditto.

for exhibiting the best steer, or young ox, of the quite accurate. [American Refiublic. short-horned breed.

Mr. John Walker, a piece of plate value £20, for the best steer, of the Herefordshire breed.

Mr. John Putland, a piece of plate value £15, for the best steer, of the Sussex breed, in working condition.

The reading of the awards being finished, the noble Chairman delivered the premiums to the respective candidates, with his accustomed urbanity, making suitable observations, and giving appropriate praise to each class of animals. He then gave, "The Judges," and thanks to them for the trouble they had taken, and for their able and judicious decisions. Mr. Bright returned thanks, for himself and his colleagues.

"The successful Exhibitors of stock," with three times three .- Mr. Putland returned thanks for the fortunate competitors: for himself he was perfectly satisfied with the decision of the Judges. (These observations excited some merriment, Mr. P. having obtained no less than four

premiums.)
"The unsuccessful candidates, with thanks to them for sending stock." The noble Chairman accompanied this toast with saying that the only way to get a premium, was by continuing to send stock to such exhibitions; knowledge and judgment were obtained, and emulation excited; and success generally was the reward.

to,

Mr. Cawston, jun. returned thanks. He said there could be no feeling of disappointment where every one was satisfied; perseverance sel-dom failed of its object; and he should for one not despair; but he rose more particularly to propose the health of Sir John Sebright, whose Michigan absence he much regretted; to him he was indebted for the origin of the stock he had shewn this day (Merinos,) and every one knew how pre-eminently successful at public exhibitions had that stock been in his (Mr. C.'s) father's tries following: hands. He would take the liberty of adding that Sir John was a most liberal and excellent landlord. The toast was drank with three times three, and every mark of affection and respect. Success to the Fleece and the Flail,

" Breeding in all its branches." Many other toasts were drank, and the company broke up about 11 o'clock.

We have to add that the dinner being on Monday, the attendance of company at the Show on Tuesday was so small, that the doors were closed at an early hour.

Mr. Champion's bull 22 months old, weighed by Mr. Pickford's machine, gave 16 cwt. 2 qrs. and 3 lbs. Of this bull we cannot but say he was by far the most complete and handsome ani-mal of his kind we have ever seen. He is called Aid-de-Camp, and was got by Warrior; dam by Charles; g. dam Miss Colling, by Prince; g. g. dam by Comet. Mr. C.'s prize cow, was Miss Colling, now 10 yeas old, and has bred eight Plough, who prefers two coulters to three, I do calves; she was got by Prince, and her dam by Comet. She is a pale red cow, having a very wide, level and beautiful carcase, with a handsome, good sized and well shaped bag. Mr. Putland's Sussex breed was very much admired. Mr. Western's Devons also had singular merit; as had likewise the Herefordshire stock.

We believe there was some hig stock from C. T. Tower, Esq. but we could not ascertain them from a want of labels.

Editor of the Farmers' Journal.

ed with considerable care, by a member from Mr. George Dodd, a piece of plate value £30, Ohio, and it is believed to be very nearly, if not am fully satisfied that there are, at least, 10

FOR THE AMERICAN FARMER.

SUBSTRATUM PLOUGHS.

Notwithstanding I have a host of eminent Farplough, who prefers two coulters to three, I do most strenuously contend that three coulters are J. S. SKINNER, Esq. necessary to constitute a complete substratum plough; at the same time I am willing to admit the 24th ult. including two seeds of the Tea Plant necessary to constitute a complete substratum rather better, and they being made in the common care of. way, will require sharpening or repairing less frequently. I ploughed 25 acres with mine, this spring, and believe I can plough 25 more, before it will want repairing. As to the draft requisite to work it, I can with confidence assert that I found not; and from a table spoonful of the seed I

The following statement, showing the classes no difficulty in working it from 6 to 10 inches and professions of the Members of the 17th Condeep, with two horses, (I do not now work the gress, from the several states, has been prepar- horses as I did prior to my first letter on the subject, but werk them abreast of each other,) and I horses on the farms which I superintend, either one of which would work my plough 7 inches deep, and follow a barshare that would complete one acre per day ; the labor would perhaps be too much, for more than one day, but I know they could do it for that period at least, in my substratum that I have to till.

With Mr. Cocke, the want of a sufficient number of teams, may form an objection to a full tillage of this kind, but I am generally able to command any number of teams, that I may stand in need of. On emergencies, I resort to a greater number of oxen than I generally use, always having young cattle suitable, on the farms, and I have in one instance, made an excellent worker of a strong cow that was almost useless as a milker. My object is to economize human labour, and if I cannot spare horses, a yoke of good oxen will work my plough, and keep at the heels of the horses in the barshare before them, which will be less expensive than a single horse in a single coulter plough, as each must have a driver or ploughman.

Your's &cc. JOSEPH DELAPLANE.

TO THE EDITOR OF THE AMERICAN FARMER.

ON TRANSPLANTING YOUNG CEDARS.

SIR.

The most eligible season for removing and transplanting the red cedar, is any time between 97 54 15 13 3 2 3 187 the months of September and June.

To insure their succeeding, it is necessary after the holes are ready for the reception of the young trees to prepare a sufficiency of earth which must be well mixed or puddled with water, about the consistency of thick paint. The holes The Members were born in the states and coun- must be filled with this mixture before the trees are introduced, that it may settle and completely cover the roots. The earth that is removed in digging the holes, if rich, will answer, if otherwise, good loam ought to be procured. The trees will grow amazingly fast if good soil is used. This useful tree for hedges has always succeeded with me when planted in this manner, and I am sure "A Subscriber" will meet with success if he will be governed by my experience. He must be careful that the roots do not become dry by exposure to the sun or drying winds before planting, as they are very susceptible of injury, and ought to be well guarded if removed to any distance.

I am very respectfully, Dear, Sir, Your obedient servant, N. HERBEMONT.

THE HAUNCH OF VENISON.

FROM THE NEW MONTHLY MAGAZINE. At Number One dwelt Captain Drew, George Benson dwelt at Number Two; (The street we'll not now mention)
The latter stunn'd the King's Bench bar, The former, being lamed in war, Sung small upon a pension.

Tom Blewit knew them both-than he None deeper in the mystery Of culinary knowledge; From Turtle soup to Stilton cheese, Apt student taking his degrees In Mrs. Rundell's College.

Benson to dine invited Tom: Proud of an invitation from A host who "spread" so nicely, Tom answered, ere the ink was dry, "Extremely happy-come on Fri-Day next, at six precisely."

Blewit, with expectation fraught, Drove up at six, each savoury thought Ideal turbot rich in: But, ere he reached the winning-post, He saw a Haunch of Venison roast Down in the next door kitchen.

Hey! Zounds! what's this? a hauch at Drew's I must drop in; I can't refuse; To pass were downright treason: To cut Ned Benson's not quite staunch; But the provocative-a haunch! Zounds! it's the first this season!

"Venison, thou'rt mine! I'll talk no more-" Then, rapping thrice at Benson's door, " John, I'm in such a hurry! Do tell your master that my aunt Is paralytic, quite aslant, I must be off for Surrey."

Now Tom at next door makes a din-"Is Captain Drew at home?"-" Walk in"-"Drew, how d'ye do?"-" What! Blewit?" "Yes, I-you've asked me many a day, To drop in, in a quiet way, So now I'm come to do it,"

I went do-my stomach's up to that, Comes quivering on the platter."

"You see your dinner, Tom," Drew cried, "No, but I don't though," Tom replied:
"I smok'd below,"—"What?"—"Venison—
A haunch"—"Oh! true, it is not mine;

let him have my kitchen range, While his was newly polished; The Venison you observed below, I guess it's now demolished.

Tom, why that look of doubtful dread? And read the "Dog and Shadow" through, When next you open Æsop.'

THE FARMEN.

BALTIMORE, FRIDAY, JUNE 21, 1822.

In this number we commence the publication of an historical account of "FRUITS KNOWN IN GREAT BRITAIN, by HENRY PHILIPS," under the persuasion that it will prove highly entertaining and useful to a great portion of our readers It is a species of reading that may be put with advantage into the hands of the children of our subscribers, whether sons or daughters; and there is no medium through which a benevolent mind is amused or instructed with so much gratification, as by the agency of our children. Information derived in this way is accompanied by the delightful reflection, that in the very act of acquiring it we are fostering curiosity, the main spring of mental improvement

As the extracts will be continued through a great many of our succeeding numbers, it might be apprehended that they would become tedious were it not that the subject necessarily divides. itself into chapters, none of which will exceed! one page.

A work on the same plan has been published by the same author, on culinary vegetables, which we are endeavouring to procure, in the supposition that it may be used in the same way that we propose to use the one whereof we have here given the introduction.

FINE FRUIT.

If it had been possible to exhibit a variety of cherries, received from our friend Mr. Willis, of Oxford-our readers would have seen in them, an ample justification of all we have said about his care and skill in the management of some of our most valued fruits—we regret that they were not at hand in time for our agricultural exhibition. Some were forwarded by Mr. W. to more desirable than any other farm of the same the President, as a rare specimen of improved and perfect fruit, and were truly worthy of their destination. Many farmers have good fruit, but cessary as, any person disposed to purchase will these cherries show how susceptible good is of course spend a day or two with me in exambeing made better, by constant and judicious at-lining the property. A small sum only will be renever misspent, even though we may not invaria- ser upon giving satisfactory security can be indulbly succeed. The studies and labour they require, are in themselves pleasing, and no farmer should be deterred by the occasional failures in WARNER WASHINGTON.

his experiments, let them rather adopt the motto, opere et fide.

AUDLEY FOR SALE.

I will sell the price on which I reside called AUDLEY.

This fine estate is situated in the healthy and very fertile county of Frederick in Virginia, 13 miles from Winchester, 10 from the Shannondale Springs, 55 from Alexandria, about the same distance from Washington, and 75 from Baltimore. It contains 1600 acres of first rate limestone land, about 1150 cleared, the balance covered with very heavy timber.

The improvements are a brick dwelling house containing eight rooms and a large saloon. A Barn 60 feet by 40, and all other buildings necessary for domestic comfort or convenience.

There is one mill within two miles of the farm, one within three, and two within four, the last two upon the Shenandoah river, and one of them worked by it. The river is navigable for boats during a considerable portion of the year. A line of stages running three times a week from Alexandria to Winchester, passes within fifty yards of the farm, and about three-fourths of a mile from the house. Snicker's Gap, at which point the turnpike road leading from Alexar dria crosses the Blue Ridge, is distant about four miles, Battletown at which place there is a post office, and through which the stage passes on its route to Winchester is distant about 2 miles.

The proprietor confidently believes, (and in this opinion he is supported by all who have seen Audley,) that fertility of soil, and advantages of situation, render it decidedly more valuable, and

size in the State of Virginia.

A more particular description is deemed unnetention. The time we give to such objects is quired in cash, and upon the balance the purcha-

HORTICULTURE.

POMARIUM BRITANNICUM,

An Historical and Botanical account of Fruits known in Great Britain, by Henry Philips -Second Edition.

(Continued from page 97.) ACORN.-GLANS.

The Oak Tree-Quercus .- In Botany, of the Monoecia Polyandria Class.

THE acorn, which is the fruit or nut of the oak tree, was the food of the ancient Britons, and particularly of the Druids, who, says the historian, lived in caves and hollow trees; their food was same means. acorns and berries, and their drink water. The name of Druid seems to be taken from the Greek word Spis, an oak. They thought whatever grew on the oak was sent from heaven, and nothing was they were compared to the oak. held so sacred by them as the mistletoe of an oak; and they believed it to be the favourite tree of the was not venerated by the Heathens only, as

Content with food, which nature freely bred, On wildings and on strawberries they fed; Cornels and bramble-berries gave the rest, And falling acorns furnished out a feast .- Ovid.

Acorns were not the food of the Britonsonly. The which was in the sanctuary of the Lord. inhabitants of Chios (in ancient times) held out a long siege, having no other food but acorns.

Acorns are eaten to this day in Spain, where they long remained a delicacy at the desserts. Cervantes often mentions them in his Don Quixotte; but the Spanish acorns are certainly of a sweeter nature than those of England.

In times of scarcity and dearth of corn, they the emperor Constantius. have been ground and baked into bread, both in to be hard of digestion, and to cause head-aches and flatulence.

The study of botany, and the encouragement given to agricultural and horticultural pursuits, the mule that was under him went away." have so wonderfully improved the state of this country, that what in early ages a king would have feasted on, the beggar now refuses; and the acorn of false hair. He had a sign painted on the front who pitch their tattered tents, and cook their scanty fare beneath the branches of the treesthat produce them.

Should there remain any persons so ignorantly obstinate, as to exclaim against the study of botathe health, and add to the luxuries of man, by this interesting and beneficial study, which, next to astronomy, carries our thoughts to heaven, and causes us to join the Psalmist in his exclamation, "O Lord, how wonderful are thy works, in wisdom hast thou made them all."

Before the Conquest, the wealds of Sussex (which is the largest valley in Europe) were one continued forest from Hampshire to Kent, principally of oak trees, that were only valued for the number of swine which the acorns maintained.

Acorns are but little used at present, except to fatten hogs and deer; they are sometimes given to poultry, and would be found an advantageous food for fowls, were they dried and ground into meal. In medicine, a decoction of acorns is reputed

good against dysenteries and colics. Pliny states, that acorns beaten to powder, and mixed with hog's lard and salt, heal all hard swellings, and ment, and applied, stay the bloody flux.

inwardly or outwardly; the bark is frequently used ple that was ever seen in Greece. Suidas informs and for sore mouths and throats. An extract has also delivered the same account; and as it made from the bark is said by some to be equal to the Peruvian bark .- Chambers.

colour their hair black.

John Ellis, Esq. discovered that acorns can be preserved in a state fit for vegetation for a whole year, by enveloping them in bees wax : other seeds may be conveyed from distant countries, by the

The ancients thought, that of all trees, the oak was made first; and that among men, the Arcadians were born first; and that is the reason why

It seems that in ancient times, the oak tree it appears there were oak trees in the temple of the true God, for the bible informs us that Joshua "wrote the commandments and the precepts of the Lord, in the book of the law, and that he took a very great stone which he put under an oak,

In the valley of Mamre, which was in the beautiful country of the tribe of Judea, where Abraham was visited by the angels who announced to him the birth of Isaac, stood an oak, that became celebrated as the tree under which Abraham of-tree. ten went to repose and refresh himself. Bayle says, that this oak was said to have existed under tree was consecrated to Jupiter.

It was an oak that caused the death of the son his head caught hold of the oak, and he was taken up between the heaven and the earth: and

A peri-wig maker in the town of Lewes, in Sussex, made use of this story to recommend the sale is scarcely known as affording nourishment to the of his shop, representing the rebellious son of Dahuman species, even among the wandering vagrants vid hanging in the oak by the hair of his head, with this whimsical couplet below;

O Absalom! unhappy sprig, Thou should'st have worn a periwig.

It was an oak-tree also which cost Milo of Crotona, the most celebrated wrestler of Greece, and ny as useless and uninteresting, let their plentiful who was always the conqueror in the games, his desserts be furnished with a scanty supply of life. He possessed prodigious strength. It is re-acorns, and their wine be exchanged for the beve-lated that he held a pomegranate in his hand so rage of their forefathers; and soon would they firmly, without hurting or smashing the fruit, that join in the praise of this science, and of all those no person could open his fingers strait, so as to take who have given their time and talent to improve it from him. He would put his naked foot on a quoit, greased with oil, and whatever effort was made it was impossible to shake it. His confidence in his (almost supernatural) strength was fatal to him, for having once found in his way an old oak-tree, nearly opened by wedges, which had been forced by the hatchet and hammer, he undertook to finish the felling of it, by the power of his arms alone; but in the effort he undid the wedges, and his hands were caught by the two parts of the oak, which joining together again, he was unable to liberate himself, and was devoured by the wolves.

The famous forest of Dodona, in Epirus, consisted of oaks that were consecrated to Jupiter; this was one of the most ancient oracles, of which

in gargarisms, for the relaxation of the uvula, us that the answer was given by an oak. Homer was generally believed to proceed from the trunk, it is easy to conceive that the priestess had nothing The gall nuts of the oak, are of many kinds, more to do than to hide herself in the hollow of this but they have all some medicinal virtue. I learn oak, and from thence to give the pretended sense from Pliny that they were used by the Romans to of the oracle, for the distance the suppliants were obliged to keep, was an effectual means to prevent the cheat from being discovered. During the war between the Thracians and Bœotians, the latter sent deputies, to consult this oracle of Dodona, when the priestess gave them this answer, of which she doubtless did not foresee the consequence, " If you would meet with success, you must be guilty of some impious action." The deputies suspected that she prevaricated with them in order to serve their enemies, from whom she was descended, resolved to fulfil the decree of the oracle; and therefore seized the priestess and burnt her alive, alleging, that this act was justifiable in whatever light it was considered; that if she intended to deceive them, it was fit she should be punished for the deceit; or, if she was sincere, they had only literally fulfilled the sense of the oracle.

> On Mount Lyczus, in Arcadia, was a temple of Jupiter with a fountain: when rain was wanted, it was thought that it would be obtained of the god by throwing in the fountain a branch of the oak

Socrates swore by the oak, perhaps because this

There was an oak near Priene, a city of Ionia, near which athousand Samians were killed by the this country and in France; but the taste of it is of David in the battle of the wood of Ephraim : Priennians. From thence came the custom that rough and disagreeable, and indeed acorns are said "And Absalom rode upon a mule, and the mule the women of Priene had to swear by the darkwent under the thick boughs of a great oak, and ness of the oak, because they had lost, in this place, their fathers, their husbands and their sons.

The veneration that the ancients had for the oak, gave rise to the Greek and Latin proverb " Speak to the oak;" which signified, speak in good security. They had also another proverb on the oak; when they spoke of persons they did not know the birth of, it was said they were born of an oak, because the ancients often exposed children in the hollow of trees.

Lucan compares Pompey to an old oak, hung with superb trophies.

The oak is a tree of slow growth, requiring a century before it will arrive to its full perfection. Pliny, in his Natural History, states, that hard by the city of Illium, there were oaks near the tomb of Ilius, which were planted from acorns when Troy was first called Illium. He also says, "the great forest Hercynia is full of large oaks, that have never been topped or lopped." "It is supposed," adds this naturalist, "that they have been there since the creation of the world, and (in regard to their immortality) surmounting all miracles whatever. The roots of these trees run and spread so far within the ground that they meet each other, in which encounter they make such resistance, that they swell and rise upwards to a great height, in the form of arches." some instances, he says, they were so high and so large that a whole troop of horsemen could ride upright through these natural portals, in order of

Linnaus mentions fourteen species of the oaktree; Miller extended them to twenty; and Aiton we have any particular account. Herodotus gives describes forty-five varieties of this tree. The two accounts of the rise of this oracle, one of most common of the English oak produces the which clears up the mystery of the fable, viz: acornsclose to the branches, without any stalk: but that some Phoenician merchants carried off a the most esteemed for ship building is found grow-priestess of Thebes into Greece, where she took ing in the Wealds of Sussex and Kent; and this cancerous ulcers; and when reduced into a lini-up her residence in the forest of Dodona, and tree often produces its acorns with foot stalks as there, at the foot of an old oak, erected a small long as the cherry stalk. Young says, "Oak is Every part of the oak is styptic, binding and chapel in honour of Jupiter, whose priestess she the staple commodity of Sussex, which, from the useful in all kinds of fluxes and bleedings, either had been at Thebes; and this was the first tem-remotest antiquity, has been celebrated for the

growth of oak; it is estimated that not less than from 170 or 180,000 acres are occupied by this timber, the quality of which is acknowledged by navy contractors preferring, and in all their agreements stipulating for, Sussex oak. This author adds, that the soil is so naturally adapted to the growth of oak, that if a field were sown with and so justly esteemed, for a variety of purposes, furze only, and the cattle kept out, the ground that it would be superfluous to state the whole of would, in a few years, be covered with young oaks, them. without trouble or expense of planting.

Although the late long war has, in some de-

and bulk, and

the sturdy oak,

A prince's refuge once, th' eternal guard Stems the vast main, and bears tremendous war heart of an English oak. To distant nations, or with sov'reign sway Awes the divided world to peace and love. Phillips.

The celebrated oak in Hainault Forest, Essex, known by the name of Fairlop, is thus mentioned by the late Rev. Mr. Gilpin: "The tradition of the country," says this ingenious writer, " traces it half way up the christian era. It is still a noble tree, though it has suffered greatly from the depredations of time. About a yard from the ground, where its rough fluted stem is thirty-six feet in circumference, it divides into eleven vast arms, which oversptead an area of three hundred arms, which overspread an area of three hundred ous days of the Romans, although Pliny says, this purpose will consume but a small portion of feet in circuit; beneath this shade an annual fair ous days of the Romans, although Pliny says, this purpose will consume but a small portion of the labour hand fair our wives at home twit us, their husbands, for the season: much of the labour may be done has long been held on the 2d of July: but no booth is suffered to be erected beyond the extent of its boughs."

In Bloomfield wood, near Ludlow, in Shropshire, is an oak-tree belonging to Lord Powis, the trunk of which, in 1765, measured sixty-eight feet in girth, thirty-two in length, and which, reckoning ninety feet for the larger branches, contained in the whole 1,455 feet of timber, round measure, or twenty-nine loads and five feet, at fifty feet to a

load.

In the vale of Gloucestershire, near the turnpike road between Cheltenham and Tewksbury, stands the Baddington oak, the stem of whose trunk is fifty-four feet : and some of its branches extend to eight yards from the body of the tree.

The famous oak, Robur Brittannicum, in Lord Norrey's Park, at Prescot, was computed to be able to shelter between three and four thousand men. Dr. Plot, in his Oxfordshire, tells us of an oak near Clifton that spread 81 feet from bough-end to bough-end, and shaded 560 square yards.

In Worksop Park, the Duke of Norfolk had an oak which spread almost 3,000 square yards, and near 1,060 horse might stand under the shade.

I have been favoured with the particular dimensions of the large oak that was felled on the Gelin's estate, in the parish of Bassaley, and within four miles of the town of Newport, in the county of Monmouth, in 1810, as communicated by the Earl of Stamford to Sir Joseph Banks.

Body of the tree, ten feet long -Twelve limbs and collateral parts, contained -1850 Dead limbs 126

2426 ft, or

FROM THE NEW HAMPSHIRE PATRIOT.

To every farm a plat of land should be appropriated solely for a garden; and if you have but one, it should contain at the least a quarter of an acre, but double that quantity may be usesustenance, comfort, and pleasure, of life; if there be a surplus, and no market for the vegetables, they may with advantage be given to catpurpose of having it under the eye of the owner, but to save time in its cultivation and the daily

To render a garden secure it should be encloson of the year till the vegetables have taken deep root, and by their vigorous growth covered the ground. The labour and care necessary for this purpose will consume but a small portion of when little else would be attended to, and the residue performed by children who otherwise would do nothing but contract habits of idleness, injurious to them in future life. A garden well managed, is an ornameut and a source of profit, but if neglected is a reproach and a loss to the

Though a garden affords neither bread or meat, less vegetable food than our health, or our comfort requires. It is certain that animal food moderate quantities with a due proportion of vegetables, it will be more useful, more healthy, and afford more ease and pleasure.

Whoever reflects on the products which cultivated gardens afford, will be satisfied that the profits of the land, as well as the labour applied to them, are amply repaid; and that our far-mers too much neglect their cultivation. If we have no gardens, or what is almost as bad, if we do not cultivate and improve those we have, richest vegetables and the most delicious fruit our climate yields. We do not sow or plant them in our fields, and if we did, neither richness of our soil or the culture would produce them in perfection. If our gardens have not been grossly neglected, they will afford us, ear-

solved, fresh parsnips of a rich saccharine nature. Later in the season, but as soon as vegetation will permit, our beds of asparagus will yield a supply of one of the richest and most delicious pot herbs or greens, that our country affordsthrough the autumn, we may have a sufficiency of beets, carrots, peas, and beans, and before trees, if properly manured and carefully mana-their value. ged, will yield potatoes; and so far from injuring will benefit the trees, by destroying the grass and weeds, and keeping the ground open and ed in every garden. Currant bushes may be loose. Potatoes thus raised afford an additional raised with ease, and preserved with little laprofit from the same land, and what is of more bour for a long period. I have never been able

Your sensible reporter for Durham has remarked, "that ruinously low prices deprive us of all hope from the fruitful appearance of our fields; and we do not hesitate to say, that nothing but ruin can be the inevitable fate of nine tenths of the cultivators, if some efficient remedy be not applied speedily to stay the overwhelming torrent of disaster." This is very true. I have long been of opinion, that if we are to have lowpriced gold, low-priced labour, and low-priced corn, our knowledge in practical agriculture would prove useless, because the relations of industry would be broken up and destroyed, by the overthrow of our personally religious and civil institutions. Indeed, I hold this as a regular and certain effect arising out of low prices.

But the arguments of my honest and industrious neighbour, farmer Jobson, has taught me to hope that I have looked too much on the gloomy side of the shield. Well, then, as my voice has been every where closed on the Currency Question, and as that question does not involve my personal interests further than as a member of the whole community, I shall for a moment step

"I can see clearly enough," says he, and he great ability, candour, clearness, and precision; spoke feelingly, for he had the appearance of one The complaint appears to be wholly in the thereby acting as a safe guide to your numerous interested, "the present race of farmers must be

to preceding numbers of the American Farmer, you know me, and that whoever may have a right are informed that they have now an opportunity which at least strongly contradict what he says to ask it of you, is welcome to know it also. " leaves no doubt upon the mind," and which if he had read, I presume that both his candour and his chivalrous spirit would have induced him to notice, previous to putting forward his re-re-assertions. At pages, 348 and 389, of vol. 1; 57, 89, 156, 339 and 377 of vol. 2, and 364 of vol. 3, your correspondent may find the restrictive system ably opposed on general principles by the agriculturists for whose benefit he urges its comple tor of the Farmer through the Easton Gazette of ET is of the celebrated improved short horned tion. At page 322, vol. 3, there is a statement of the 22d, has been cut out and forwarded to New- breed, but belongs to the tribe of deep milkers, the dreadful effects on agriculture, arising from the existing high duties, and at page 182, vol 3, time it is but fair to state that our impressions tion to fatten. At 13 months old he weighed 843,

more to expect a change of matter in a new publication, than to change the quality of small beer, out of ten preserve their papers. by pouring it out of a junk bottle into a decanter. Thus his "three letters, &c." were poured out of his "addresses," again poured into his "new Olive Branch," (all of which I have seen, and what is more, have read,) and I have no doubt the same stale draught is again presented in his late appeal to common sense, which appeal it is much to be regretted he did not make at least ten years sooner. If this author and his followers would only vary their eternal fare ever so little, if they would only convert their cold broken meat into a it is past endurance to be called to "cut and come

doubles our first feelings of disgust.

You lately intimated a wish to exclude all pieces on this or other subjects, relating to the interests of Agriculture, unless signed by the real names of their writers. This custom is excel-lent when agricultural experiments and facts are stated, because their value rests entirely on the credibility of the author, and we ought to attach none to a fictitious signature. But I protest against the rule being extended to arguments which necessarily rest upon their own strength, and not at all (or at least they ought not) on the name of their author. I wish to see your paper fairly open to both sides, on every question affecting the welfare of agriculture, and it is admitted by all, that none affects it more than this. By excluding anonymous pieces, you would forbid all farmers to join in the debate, while enough men of different habits would have no objection to placing their names before the public, for the purpose of attacking our dearest interests. Nor will you do us more justice by allowing a fair field to them have been, our cause would be desperate, \$2 50. was it left entirely to be defended by such inert champions. On the other hand, in towns. (par the present week, at the following prices:-Fine ti ularly Philadelphia,) Societies, Conventions and Institutions, for supporting the views of the manufacturers, may be easily made upon any occasion, taking new names every month, and each individual acting as many characters, as the farm of the late Dr. Colegate, sold for \$18-one saving of labour in hay making time, when labormembers of a reduced company of strolling players. Besides, your correspondents could easily deceive you into violating your own rule, by merely signing John Smith, William Thompson, on any other unappropriated name, which you could not possibly know to be fictitious. For myself, I am not willing to place my name before the public, except in stating facts in agriculture, in which cases, it shall always as heretofore be subfoined. For other matters, it is sufficient that COMET, exhibited at the last Cattle Show, they

PATENT HAY AND GRAIN RAKE.

Messrs. Pennock and Pierce, of Chester coupty, Pennsylvania, have lately patented, and used during the last and present season, a horse rake for gathering hay or grain, into wind-row, or heaps, as desired. The plan of this machine is uncommonly simple, and one of them may be made by any rough carpenter, or person accustomed to the use of tools. The price of this rake complete, including the patent right, will not exceed ten dollars, or for the patent right, two dollars only.

We have seen this machine in operation; it does the work quite as well, if not much better, than it is generally performed by the hand rake, and with one man and a horse it is believed that it will do the labour of ten or twelve men. Its ad--Corn, white, 75 cts.-yellow do. 72-Red wheat vantages over the common horse rake are very horse proceeds continually on, the hay or grain being discharged at pleasure, and without any stoppage or impediment; by the means of which ty, and cheapness of this instrument, renders it an object highly to be desired by agriculturists, for its

AGRICULTURE.

Maryland Cattle Show, No. 2.

pursues his round of toil, and the satisfaction he increased by the approval of a friend or neighbor; and when he lights upon some new discoveciations to supply all these deficiences, and none of barren hills and exhausted fields in some parts of interests of the plough. Maryland, where alternate crops of Indian corn ficial grasses has been followed by profitable and frequently luxuriant crops.

Our instruments of agriculture are receiving daily some improvement, and every combination and invention of Mechanics have been put in requisition to save animal labour. Foreign coun- by Mr. Skinner, for the first regular ploughing the most improved breeds of domestic animals are imported. By analyses the demands of our different soils are now particularly ascertained, barren clay is found by the agency of fire, (the most de- the whole exhibition. The paramount importance structive of the elements) to give nourishment of the implement to be tested, the novelty of the and strength to an exhausted soil, and having competition, the beauty and excellence of the

a layer or stratum under ground.*

On the present occasion it was highly satisfactory to observe how fully the committee of arrangement had availed themselves of the experience afforded by the former and first attempt. The chief defects developed on that occasion were now removed, and all their previous arrangements for the show were seen to glide at once into full and fair operation. The Judges to award the Premiums appeared on the ground at an early hour, and being furnished with a warrant of authority and a designation of the objects to undergo their examination and award, every one remarks of commendation to each and of encourentered apparently with the greatest cheerful- agement to others to follow their good example. ness on the performance of the duties assigned To each committee a marshall was appointed, by whom all the members were collect ed and made known to each other, and the whole business of the day was entered upon without report, that they have carefully and with great interruption or delay. The proceedings were moreover very much facilitated by the way in descriptions exhibited for premium, and are of which the enclosures were arranged. The pens formed a hollow square, each one being numbered and distinctly labelled with the name of the animal, its owner, its pedigree, and for what premi-

FIRST DAY.

The exhibition held on the two last days of May, by the Maryland Agricultural Society was attended by a great number of Farmers and Citiat tended by a great number of Farmers and Citiat tended by a great number of increased interest. zens who appeared to take an increased interest the members did from the inside of the square impart some of the most indispensible qualiin the concerns of agriculture : this is as it ought formed by the pens. Prom Thornton's Family Herbal. THE OAK.

Uses .- Oak saw-dust is the principal indigenous vegetable used in dyeing fustian. All the varieties of drabs, and different shades of brown, in dyeing as a substitute for galls. An infusion of the bark, with a small quantity of copperas, is used by the common people to dye woollen of a purpfish blue, which is sufficiently durable.

But the chief use of the bark of this tree is for the process of tanning. Before we detail the process, it may be proper to observe, that raw hides and skins being composed of minute fibres intersecting each other in every direction, the general taken out, and the hair scraped off on a wooden operation of tanning consists chiefly in expanding the pores, and dissolving a sort of greasy substance contained in them; and then, by means of the astringency and gummy resinous properties of oak bark, to fill and reunite them, so as to give firmness and durability to the whole texture. But this three times a day, for the first week; every setheory has been controverted by some chemists, who suppose that the animal jelly contained in the skin is not dissolved, but unites during the process till at the end of a month or six weeks they are

The process of tanning varies considerably, not only in different countries, but even in different ther pit called a layer, in which they are laid parts of the same country. The following is the smooth, with bark ground very fine strewed bemethod most approved and practised in London and its vicinity, where the best leather is general- three months, they are generally taken up, when ly allowed to be manufactured.

forms a combination insoluble in water.

The leather tanned in England consists chiefly of three sorts, known by the name of butts or backs,

hides, and skins.

heaviest ox hides, and are managed as follows: After the horns are taken off, the hides are laid smoothed by a steel pin, are, when dry, fit for smooth in heaps for one or two days in the summer, sale. and five or six in the winter: they are then hung

The hides are then taken out of the scowering, and spread smooth in a pit commonly filled with water, called a bindview it more especially as an agricultural ex-er, with a quantity of ground bark strewed between each. After lying a month or six weeks, conclusion to the more formal proceedings of they are taken up; and the decayed bark and liquor being drawn out of the pit, it is filled again with strong ooze, when they are put in as before, of shoes, boots, &c. with bark between each hide. They now lie two of other pursuits, can now be brought together for or three months, at the expiration of which the the discussion and improvement of their own same operation is repeated; they then remain four or five months, when they again undergo the rational festivities-its science, its literature, same process; and after being three months in the last pit, are completely tanned, unless the hides are so remarkably stout as to want an additional sinous matter, and will therefore tan leather as pit or layer. The whole process requires from effectually as the bark itself. This opinion, which eleven to eighteen months, and sometimes two years, according to the substance of the hide and Howard (Phil. Trans. vol. ix.), has since been pit to be dried, they are hung on poles; and after that the bark of birch will answer the purpose of being compressed by a steel pin, and beat out tanning even sole leather, which, it is well known, smooth by wooden hammers called beetles, the requires the strongest and most penetrating mateare made with oak saw-dust, variously managed and compounded. Oak apples are likewise used they are fit for sale. Butts are chiefly used for the operation is complete; and when thoroughly dry, rials. soles of stout shoes.

The leather which goes under the denomination of hides is generally made from cow hides, or the lighter ox hides, which are thus managed: After the horns are taken off, and the hides washed, they are put into a pit of water saturated with being taken off, they are removed into a pit of weak ooze, where they are taken up and put down (which is technically termed handling) two or fresh ooze, somewhat stronger than the former: with the astringent principle of the bark, and put into a strong coze, in which they are handled once or twice a week with fresh bark for two or three months. They are then removed into anothe ooze is drawn out, and the hides put in again with fresh ooze and fresh bark; where, after lying two or three months more, they are completely tanned, except a few very stout hides, which Butts are generally made from the stoutest and may require an extra layer: they are then taken out, hung on poles, and being hammered and adopted.

The hair is then scraped off, and the flesh and excresences being removed, they are put into a pit of water impregnated with pigeon dung (called a grainer or masprepared in pits called letches or taps kept for the tring), forming a strong alkaline ley, which in a week or ten days soaking out the lime, grease, and saponaceous matters (during which period they lightened friend and benefactor of agriculture, ed into another pit called a scowering, which con-&c. &c. skins, and prepares them for the reception of the coze. They are then put into a pit of weak coze, by distending the pores of the hides, occasions in the same manner as the hides, and being frequently handled, are by degrees removed into a stronger and still stronger liquor for a month or six weeks, when they are put into a very strong ooze, with fresh bark ground very fine, and at the end of two or three months, according to their substance, are sufficiently tanned; when they are taken out, hung on poles, dried, and fit for sale.

These skins are afterwards dressed and blacked by the currier, and are used for the upper leathers

The lighter sort of hides, called dressing hides, as well as horse hides, are managed nearly in the same manner as skins, and are used for coach-

work, harness-work, &c.

It has been said that every part of the oak tree contains a great portion of astringent gummy-rediscretion of the tanner. When taken out of the countenanced by the celebrated Buffon; who adds,

A long memoir, written by M. Gleditsch, recommends the leaves, branches, fruit, and flowers; of a vast number of plants as substitutes for oak bark. Heath dried and pulverised, gall nuts, and the bark of birch, are said by M. Gesner to be used in different provinces of Germany. Abbé Nollet informs us, that the leaves of myrrh, are used by the tanners in Naples. In Corsica they make use lime, where they remain a few days, when they are of the leaves of wild laurel dried in the sun and beaten into powder, and in the island of St. Kilda beam, as before described: they are then washed they tan with the tormentil root. In some parts of in a pit or pool of water, and the loose flesh, &c. Italy leather is tanned with myrtle leaves. In Russia it is said that leather is tanned with the bark of willow; and it may here be observed, that a late writer has recommended the extract of bark to be made in America, in order to lessen the expense cond or third day they are shifted into a pit of of freight, &c. in conveying the bark itself to Eu-

> In the year 1765, the Society of Arts, &c. granted a premium of £100 for the discovery of a method of tanning with oak-saw-dust; which method has been adopted in Germany: and the Rev. Mr. Swaine has lately revived the exploded substitute (mentioned by Gleditsch and others of oak leaves.

> Anthony Day, esq. of London, obtained a patent, dated 17th July 1790, for a new method of tanning, "with half the bark in half the usual time." This plan chiefly consists in concentrating the bark into a strong extract, and in some mechanical improvements in the construction of the tan-yard, But neither the one nor the other has yet been

An ingenious manufacturer in London has, by the application of warm air, conveyed by means These hides are called crop hides: they are of flues from stoves properly constructed, and by other contrivances not generally known, considerably abridged the usual process of tanning. Some experiments have likewise been made with the

bark of ash and of horse chesnut.

A substitute for oak bark, the price of which has lately been enormous, is the grand desideraabove enumerated have hitherto been found ineffectual; but a patent, bearing date 16th January, 1794, has been granted to Mr. Ashton, of Sheffield, Yorkshire, for his discovery of a cheap and expeditious method of tanning leather. This method of the others. chiefly consists in applying a preparation of mine-ral substances instead of oak bark. Those which, on account of their cheapness, are most to be preferred, are the dross of coalpits, called sulphur or red ochre; and, in general, all astringent, sul-phureous or vitriolated substances.

by reducing the expense, may ultimately be of great advantage to the public. Many other experiments are now making in England for the imleather manufacture, much may be expected from

their industry and skill.

The revenue arising from the duty on leather terwards cured by the Peruvian bark.

tanned in Great Britain (exclusive of oiled leather) is upwards of £200,000 per annum.

MEDICAL VIRTUE.

The astringent effects of the oak were sufficiently known to the ancients, by whom different parts of the tree were used : but it is the bark which is now directed for medicinal use by our pharmacopæias. To this tree we may also refer the gallæ, or galls, which are produced from its leaves by

means of a certain insect.

Oak bark manifests to the taste a strong astringency, accompanied with a moderate bitterness, qualities which are extracted both by water and by rectified spirit. Its universal use and preference in the tanning of leather is a proof of its great astringency, and like other astringents it has been recommended in agues, and for restraining hamorrhagies, alvine fluxes, and other immoderate evacuations. A decoction of it has likewise been advantageously employed as a gargle, and as a fomentation or lotion in procidentia recti et uteri. Dr. Cullen tellsus, that he has frequently employed the decoction with success in slight tumefactions of the mucous membrane of the fauces, and in prolapsus uvulæ, and cynanche tonsillaris, to which some people are liable upon the least exposure to cold: and in many cases this decoction, early applied, has appeared useful in preventing these disorders. It must be remarked, however, that the doctor almost constantly added a portion of alum to these decoctions.

Some have supposed that this bark is not less efficacious than that of the cinchona, especially in the form of extract; but this opinion now obtains little credit, though there be no doubt that oak bark may have the power of curing intermit-

Galls, which in the warm climate of the East are found upon the leaves of this tree, are occasioned by a small insect with four wings, called Cynips querci folii, which deposits an egg in the substance of the leaf, by making a small perfora-tion through the under surface. The ball presently begins to grow, and the egg in the centre of it changes to a worm; this worm again changes to a nymph, and the nymph to the flying insect abovementioned, which by eating its passage out, leaves a round hole: and those which have no fold in the skirts, begin at the tail and fold it up mind to send your strawberry vines at the proper tholes are found to have the dead insect remaining close and firm, until you come to the neck which them.

FULLERS' EARTH.

The Woolen Manufactories of this country are suffering for fullers' earth of good quality .-Any person having a bed of it on his farm, may

calculate on its being of more value than a mine of either iron or copper. The presence of a large portion of silectious earth is the prevailing character of this mineral.

It is classed by Thompson as belonging to the soap stone family, and it should be sought for in the neighbourhood of soap stone rocks, or in valleys contiguous to mountains in which silectous rocks abound. When dry it should be very soft and slippery like hard soap; and when thrown into water, it should fall into a fine mass resembling the appearance of curds. If this moist precipitate will wash grease out of woollens, and has no sensible grit, when rubbed between the fingers, it must approximate towards fullers' earth, and would be well worth a trial on a large scale,

Any person having clay answering the above description, by leaving a sample at the office of the Statesman, carriage paid, may have it examined by a good judge, and a report left at the

office of its quality.

THE FARMER.

BALTIMORE, FRIDAY, JULY, 5, 1822.

The prices of the present week are much the same as our last report, but few parcels of grain brought to market, and these not much sought for. White wheat, \$1 37 to \$1 45-Red do. \$1 30 to \$1 37-White common, 75 to 78-Yellow do.

72 to 75—Rye, 68 to 70—Oats, 40 to 45.

MARYLAND TOBACCO.—The finer qualities, same as last report, and scarce:—Common do. more in demand, but no advance in price.

Sinclair's Sowing Machine.

We think that this machine, which being founded on the principles of Bennet's Drill* has been coupled by Mr. Sinclair to a horse power, will be found particularly valuable on large estates, and to those persons whose other business may prevent their superintending the sowing of their crops; for the own er may in a few moments teach others to set this machine, so as to sow whatever quantity or kind he pleases, from the finest to the largest seeds or Plaster of Paris, and from two quarts to three bushels, of either, per acre.-Edit. Am. Far.

The subscriber has contrived a machine for sowing all kinds of grain, grass seeds and plaster of Paris by horse power, which driven by a man will sow much faster than could be done by hand, and with such great regularity and economy in the distribution, that whilst at every step it completely sows a breadth of twelve feet, it saves about one fourth of the seed or plaster usually bestowed. I have manufactured and sold some of these machines, during the two last years, so that they have been satisfactorily tried in Massachu setts, New York, Virginia, and by several individuals in Maryland, where the agricultural society convened near Baltimore, has recently examined one of the machines and awarded a premium in testimony of their approbation of its construction and design. And many intelligent and zealous agriculturists have, after trying this machine, written to me respecting it, in terms of approbation similar to those which are accorded by the respectable writers of the following remarks:

Extract from a letter received by me, from James M. Garnett, dated Fredericksburg, Virginia, April 1822.

"With your sowing machine, I am more pleased than with any new thing that I have ever " tried. I have used it with oats, orchard grass, " clover seed and plaster of Paris, each separate "ly; and think myself authorised to state, that " no mode of sowing either, which I have ever seen " or heard of, is comparable to it, both for dispatch and regularity of distribution: It is manifest that it would sow wheat, rye and barley equally well.

Extract from a letter likewise received from Virgil Maxy, dated near Annapolis, Maryland Aov. 1821.

"I have made a fair experiment with your machine for sowing broadcast, and the " result enables me to say with great sincerity, " that I consider this machine a valuable addi-"tion to our agricultural implements. By means " of it, a man with one horse will sow wheat about

* See American Farmer, Vol. 2, page 384

" saving of labour therefore, is very considerable, "but the uniformity and exactness with which it distributes the grain, an important point not "completely attainable in sowing by hand, how-" ever careful the sower may be, constitutes its greatest recommendation.

An intelligent servant will learn in an hour

how to use it.

" I have made tria, of the machine in sowing wheat only. It will however, unquestionably, "be equally useful in sowing rye, oats, and plaster of Paris."

The price of the machine, as represented in the above cut, is \$55, or without the carriage \$35. The subscriber has constantly on hand a complete assortment of the most useful agricultural implements of his own manufacture, for sale at reason able prices.

HORTICULTURE.

POMARIUM BRITANNICUM,

An Historical and Botanical account of Fruits, known in Great Britain, by Henry Philips. -Second Edition.

(Continued from page 106.) APRICOT.-ARMENIACA:

Or Præcocia Mala .- In Botany, of the Class Icosandria Monogynia.

The apricot has long been considered, and in most botanical works stated, to be a native of Epirus; and the name of fruneus Armeniaca having been given to it in mistake, and which I shall shew belonged to another fruit, it has been great care should be used, in pruning, not to intransmitted down from one author to another, without particular inquiry. Theophrastus, one of the oldest authors, never mentions the apricot-tree as being cultivated in Greece, at the time when he lived: on the contrary, he alludes to it as an exotic, from an account transmitted on plum stocks. to him: he also mentions the almond, as being the only tree in his country which produced the flowers before the leaves. (Theoph. Hist. Plant. tib. vii. c. 12.)

Columella is the oldest Roman author who the apricot. He writes, that at the end of January we may graft the cherry-tree, the Armenian plum, the nectarine, the almond, the peachtree, and others which plush early.

Pliny also mentions the Armenian plum; and says there is a plum, a kind of apricot, brought from a foreign nation, and which is called Armeniaca, and is desirable for its smell. This great naturalist has particularly mentioned the apricot, as distinct from the Armenian plum : The Name of a Genus of Trees, of the Icosanhe states that it was not known above thirty years before he wrote the account, which would make its introduction into Italy about the sixtieth year of the Christian era. Pliny says, "at writers. its first coming, each sold for a Roman denier:" Jacob procured.

near to its Arabian name of berkach, or berithe candlestick. And in the six candlesticks kach." M. L. Legneir adds, "that the inhabitants of the Deserts called Oasis, gather and all his flowers." dry large quantities of apricots, which they bring down to Egypt for sale; and they are there fore Christ, mentions the almond as the only called michmich." "The result of every inquistree in Greece that produced the called michmich." "The result of every inquitree in Greece that produced the blossoms berry I made," says this author, "was, that the fore the leaves. Servius relates the traditionapricot-tree grows there spontaneously, almost ry tale of Phyllis's being changed by the gods without cultivation; and as it is not known to into an almond-tree, which was called phylla Bridge.

(Gough's British Topiography, vol. i.

we have now considerable varieties of this agreeable fruit, many of which, by their names, inform us from whence they were procured, as England, in the reign of Henry the Eightli, the Algier, the Roman, the Turkey, the Brede, 1548 (Hortus Kewensis.) Lord Bacon, whose and the Brussels apricot, besides the Muscadine, Natural History was written some years after this the Orange and several new varieties. It is one time, mentions it among the trees that blossom of our earliest wall-fruits, as well as one in the earliest, and whose fruit ripens latest; and which highest estimation.

crop, makes an excellent tart; and, when ripe, it is second to no fruit for preserves or jam.

The apricot-tree produces its blossom buds not only on the last year's wood, but also on the as a nourishing diet. foreright shoots in the growing time.

The Brussels apricot is the best as a standard tree: they are all propagated, by grafting them cooling, healing, emolient, and nutritive: they

The 2d. Premium. To John Hare Powel for Oakes, from Mr. Quincy's Oakes Cow, (which produced 4844 lbs. of butter in one year,) by the imported thorough bred improved Durham short horn Bull Cœlebs. The 3d. Premium, 10 To John Hare Powel, for Baron from the Queen by George. The 1st. Premium for Cows, not more than 7, nor less than 3 years old, 50 To John Hare Powel for Flora, an imported thorough bred improved Durham short horn Cow, of 4 years, descended from Comet. The 2d. Premium. 20 To John Hare Powel for Rose, an imported thorough bred improved Durham short horn Cow, of 6 years, descended from Comet. The 3d. Premium, 10 To John Hare Powel, for Steam Boat pedigree not known. The 1st. Premium for Heifers not more than 3, nor less than 1 year old, To John Hare Powel, for Clarissa, from 20 Stone's Cow, by Denton. The premium for the best Heifer, not more than 3 years old, which shall have calved twice, reference being had to her offspring. 40 To John Hare Powel, for Prize, from Bughorn, by Denton.
The 1st. Premium for Heifers, not more 20 than 12, nor less than 6 months old, To John Hare Powel, for Lucinda, by Denton, from Star, begotten by the same. The Premium for the best Heifer, of Teeswater or Durham blood, not more than 3, nor less than 1 year old, 20 To John Hare Powel, for Fairy, from Prize, by Denton. The Premium for the best Heifer of Devon blood, not more than 3, nor less 20 than 1 year old, To John Hare Powel, for Julia, of 18 months, by Denton, from the imported Cow Devon. In addition to the above stock, John Hara

Powel exhibited two imported heifers, six cows, (three of Teeswater blood) and two bull calves, was by Phenomenon-he was by Favourite, Mr. Anderson's Steer of 4 years had attained Favourite was by Old Favourite, which begat great height, but as he had neither the breadth, Comet, from whom Rose, the dam of Lothario, experience has proved to invariably accompany this bull calf decidedly excelled, in all his points, Committee are obliged unwillingly to place him seen, but being not 6 months old he was excluded from premium.

the benefit of the Society.

The 2d. Premium for Bulls, not more than

4, nor less than 2 years old, To Mr. Manuel Eyre, for Leopard, derived from Teeswater stock, imported by Mr. Heaton.

In addition to this bull, Mr. Eyre presented a very large yearling bull, and a bull calf, both of great promise, four very fine cows, two of which were marked by clean heads, necks, and heavy hind quarters, also four heifers partaking of the strong Teeswater points of his other stock.

The 4th. Premium for Bull Calves, not more than 12, nor less than 6 months

To Mr. Rose, of Delaware county, for Major, from his white Cow, by Mr. Powel's Bull George, derived from Teeswater Stock, imported by Mr. Heaten.

Mr. Rose exhibited the Dam of Major with four of her offspring, all of which showed many of the milking points of the Cow.

The 2d. Premium for Heifers, not more than 3 nor less than 1 year old, To Mr. Aaron Clement, for Lucy, by

Mr. Powel's Bull George, from a Cow of the same blood. The 3d. Premium for Heifers, not more

than 12, nor less than 6 months old, To Mr. Aaron Clement, for Laura, from a Kentucky Cow, by Mr. Powel's Bull George.

The 4th. Premium, To Mr. Aaron Clement, for Kate, from Lucy, by Mr. Powel's Bull George

Mr. Clement showed, in addition, three fine steers of Teeswater and Kentucky blood, two yearling bulls, one remarkable 5 years old Teeswater bull derived from Mr. Heaton's stock, and six cows, very strongly marked with Teeswater points; one of them particularly attracted the notice of the Committee as showing the blood of Mr. Ketland's importation of short horn Cattle of Collings' breed.

The 3d. Premium for Heifers, not more

than 3 nor less than 1 year old, To Mr. Thomas Serrill, for Red Beauty, by Mr. Justis's Kentucky Bull, from a very fine Cow derived from Mr. Ketland's importation.

The 4th. Premium for Heifers, not more than 3 nor less than 1 year old, To Mr. Henry Serrill, for White Daisy, from a fine Holstein Cow, by a Bull of

the same breed. Mr. Henry Serrill exhibited two steers of two and beautiful points which generally mark the progeny of Mr. Ketland's Cow.

The 2d. Premium for Heifers, not more than 12 nor less than 6 months old, To Mr. Samuel Cox, for a white Heifer

of 7 months, of Holstein blood. Cow, and well a shaped large Bull, good specimens from which they were derived.

of Holstein Cattle. The Premium for the best Ox, not more than 8, nor less than 5 years old,

To Mr. Smith of Delaware County, for

Lofty of 5 years. Mr. Smith also exhibited two cows, a heifer, and a remarkable ox, which caused the Com-mittee to hesitate in awarding the prize to Mr. Grier presented two very fine broad tail mittee to hesitate in awarding the prize to Lofty. The cows were evidently of the Kentucky breed, and showed, particularly about tions. their heads, horns, and hind quarters, much of Mr the character of the short horn family, of which hibited a fine Ram of Tunisian Blood. several animals had been carried to the country in which they were bred. The Premium for the best Steer, not

more than 5, nor less than 1 year old, \$10 To Mr. Lowry, for his brindle and white Steer of 3 years, raised by himself.

THOMAS SMITH, GEORGE SHEAFF, CHARLES LLOYD.

THOMAS SERRILL, Assistant Judges.

To the Hon. WILLIAM TILGHMAN. Chairman of the Stock Committee.

> MANUEL EYRE BENJAMIN SERRILL, LEWIS CLAPIER. JOHN TOMLINSON, Assistant Judge.

To the Hon. WILLIAM TILGHMAN, Chairman of the Stock Committee,

The Committee appointed to superintend the mals imported by Mr. Beens. The Committee performance of Oxen, in the plough, report—cannot too highly extol the successful efforts of That George Sheaff's oxen, with a ploughman these spirited breeders, in distributing through- and a driver, ploughed one eighth of an acre of out our Country a family of animals so remarka-stiff sward land, an average depth of 7 inches, in years, one of them showed decided points of Mr. ble for early maturity, great size, tendency to 24 minutes, that John Hare Powell's oxen, with a Patterson's importation, the other, the good shape become fat, as well as length of staple and ploughman but without a driver, ploughed the same quantity of the same land, an average depth of 6 inches, in 25 minutes; that William Flower's oxen, with a ploughman, as well as a driver, ploughed the same quantity of land an average depth of 6 inches in 27½ minutes.

The Committee has had much difficulty in de-

ciding between the merits of Mr. Sheaff's and Mr. Powell's oxen, but in consideration of the latter Mr. Powel exhibited twenty-one broad tail having ploughed with a ploughman alone, they do

> CHARLES LLOYD, ALLEN THOMAS, Jr. REUBEN HAINES, HENRY SERRILL. AARON CLEMENT,

To the Hon. WILLIAM TILGHMAN, Chairman of the Stock Committee.

The Committee appointed to make trial of the Two Wethers were exhibited by the Directors, which Mr. Charles Kuhn had taken from en ploughs were offered, one by Mr. Stevens, of one by William Suplee, of Darby, one by David our modes of husbandry Dickenson, one by Mr. Wright, of New Jersey, and one by Joseph White, of Downingtown, made wholly of iron. After having carefully examined the construction, and accurately tested the per-formance of them by means of the dynanometer, they are decidedly of opinion, that Mr. Steven's Plough deserves the Medal, inasmuch as it requires less force to draw it, and is better adapted for the general purposes of our farms than any other plough they have seen.

For a premium of five dollars they recommend Mr. Suplee's plough, as it is well fitted for turning sward land.

Although the other ploughs have much merit, yet as it does not come within the scope of the duties of your Committee, they do not enter into a

detail of their performances.

The Committee were very much struck by the cheapness, strength and extraordinary performance of Gideon Davis's improved Shovel Plough, drilled crops.

an ingenious contrivance for cleaning ploughs, obliging as to give it insertion. which, in the opinion of the Committee, is well

Mr. Williams's Horse Hoe appears to be admi-

rably adapted for tilling drilled crops.

A Turnip Drill Harrow, two cultivators, and an Ox Cart somewhat improved, were sent to the ground by John Hare Powell.

Chapman & Rawley's Machine for breaking mittee which had on a former occasion, awarded to it the premium of two hundred dollars .- Your husbandry of Pennsylvania.

Mr. Baily's Mowing Machine satisfied the Committee, not merely by its performance during the slight trial which they were enabled to give it, but by the general impression which it has made throughout one of the finest Counties of our State, that it is well fitted for mowing lands which are not uneven, therefore, they recommend it for a discretionary premium of Fifteen Dollars.

Mr. Eastman's Chaff Cutter could nut fail to obtain their approbation, by its rapid and effective movement, in cutting not only straw, but even sticks an inch in diameter, without injury to its knives; the facility with which it is made to

it for a premium of ten dollars.

Mr. Barnard's Chaff Cutter deserves the notice of the Committee (although it is not an original invention,) for the facility with which it is made to operate; its simplicity and cheapness are great recommendations, and as it has had the test of experience, your committee are disposed to prefer it to most implements of the sort which they

TO THE EDITOR OF THE AMERICAN FARMER.

Fredericksburg, (Va.) June 19th, 1822.

SIR,

I have for some time intended to inclose to you the within extract (from the European Magazine of 1800) for publication. Many of our best farmers in the state, have had a view of it, any advantage will result to the farming por-Mr. Joseph Kersey, of Downingtown, exhibited tion of the community from it, you will be so

These experiments though made in a foreign calculated to effect the object for which it is in- country, and in a climate and soil very different from our own, are I think calculated to benefit us on this side of the Atlantic, regard being had to the great humidity of the one, and often extreme dryness and heat of the other atmosphere. It is I presume, pretty well known at this day among our farmers, that in applications of British Husbandry to our me-Flax without wretting was again subjected to the severe trial of practical men, the opinions of regularity of her seasons, and the extreme irwhom, perfectly coincided with those of a Com-regularity of ours. Her winters are longer and much more temperate than we generally have wife has been disposed to war against the them, and our summers considerably warmer Committee therefore do not hesitate to declare, and dryer. The frosts are seldom either so early or late, and of that severity, as to injure tant machines which can be brought to aid the the crops of that country; while with us, scarcely an autumn, winter, or spring passes, but that great injury is done to the wheat crop, in consequence of the early and late influence of severe cold weather; this too, with an irregularity (alternately of heat and cold) that must always render the crops extremely precarious. present season throughout the middle, Northern and Eastern sections of the Union, is an awful admonition to us of this fact; for, I have scarcely seen or heard of a good crop, either in this, or any of those states. The fly, severe winter, and chinch bug, have ranged in every direction with almost indiscriminate destruction-and what is very much to be lamented indeed, a cut straw of different lengths, adds much to its generally, of an extreme moderate use of plaster, and clover seed. This circumstance, added to the general disposition they have of blending the grazing system to an excess, with the extensive culture of wheat, contribute to deteriorate the land, which renders the wheat Observations made by Nathaniel Kent (his less able to resist the various disasters to which Britanic Majesty's Manager, or principal farmer it is so unfortunately liable.

In my opinion from an extensive view of the agriculture of our country generally, and a constant and regular research into farming operations and experiments of a very great many in-Mr. Moses Pennock of Chester County, presented a new modification of a revolving Horse Rake, which the Committee have not had an opportunity of testing by experiment, but as the general impression of those who saw it was much in its favour, they are led to believe, that it is an improvement worthy of imitation.

Among the various imported implements which were shown, your Committee were not enabled stant and regular research into farming operators and containing 4000 acres,) in a letter to the secretary of the Society for the encouragement of arts, dustrious, practical men, there certainly is no one circumstance so badly understood among them, as that of expending money and labour in the improvement of soil, with regularity, judgment, and constancy. They have only periodical visitations of improvement upon large and extensive scales, which they often indulge in most lavishly and injudiciously; when this

sey, one by Gideon Davis, of Georgetown, D. Colto discover any thing likely to become useful in subsides, which it is sure to do in two or three years: they then revert to a rigid making, and close saving system. Taking all they can possi-bly get from the soil, leaving and giving nothing to it. By this means agriculture is either abandoned by them, or they become so crippled in their fortunes by impoverished soil, and miserable crops, as to produce abdication, and consequent migration to some one of our new states or territories.

A farmer to be prosperous in our country, must lay down a system of improvement commensurate with the means he has of giving force and vigour to it. His plans and his habits ought never to exceed a most rigid regard of prudence; and in ordinary times at least, he should recol-lect that a failure of his crop in a small degree even, must be attended with great injury to him. For his family, overseer, negroes, farm and stocks, are to be supported; and his physicians, and blacksmith's bills, his taxes, levies, and a variety of contingent charges, are to be and although they had not an opportunity of test-ing it properly, they are led to believe that it will be a valuable acquisition in the cultivation of Journal. If your impression should be, that of his children. A course of management then calculated to realise an object in the aggregate of so great importance, ought assuredly to engage the closest attention and study of every farmer, especially those who have to depend sole-ly upon agriculture. I have often remarked, that with a resolution in the commencement to be independent, a farmer will be so; because, for a few years he indulges in neither luxury nor superfluity. He learns economy, and he gathers much useful knowledge. He is young, and may be industrious and prudent. His family is of course small. His wife naturally bends to his own views; and from thirty years experience, I have really found very few instances, where a peace and happiness of her family. It is only requisite then in my opinion, for them to know the extent of their resources; and the most or-dinary reflection will at once teach them to resist temptations to expense, which cannot be supported, and which, if indulged in, must so obviously prove ruinous. Thence it is, that I draw the deduction, that it is in every farmer's power to live within his means. Industry, prudence, resolution, and equanimity, will insure it to him-and a few years perseverence will assuredly improve his fortune; while a habit thus correct, and important to him, will hever after escape him. His mind is thence perfectly relieved; and his course through life becomes clear and determinate.

With an apology for so great a digression from the subject of the proposed publication.

I remain, Sir, respectfully,

Your ob't serv't CARTER BEVERLEY.

Extract from the European Magazine for April 1800.

on his farms in the green park at Windsor, cal-

course shift, first wheat; second turnips; third land, in the manner that sheep are penned, with When this has been continued, at intervals, dubarley, with seeds (viz. grass seeds,) which con- this only difference, that the turnips were thrown ring the winter, a layer of lime, chalk, rubble, tinue laid two years. The seeds however turned up into cribs, instead of being left to be trodden or ashes, six inches thick, is spread over the to very little out after the first year. The course into the ground, and in the nights they were drivwas five shifts of 100 acres each. The first, was wheat or rye; second, the irregular shift; third, tered with rushes, fern and leaves, and turnips turnips; fourth barley or oats; fifth, clover.— and barley straw given to them in cribs. They manure that can be used for turnips. For clover Strong or cohesive soil answers best under a four thrived fast, and every one of them made at least course shift, first year wheat; second cabbage or eight loads of good muck in the night yard, becarted and pretty thickly scattered, then sow it clover; third oats; fourth beans. The irregular sides the benefit done in treading and dunging on with vetches, which are nearly as valuable as the shift is partly productive and partly preparative: the land in the day time, which was very great, 40 acres of it were sown with vetches, to be fed the soil being very light. The result of the ox off; 40 acres with rye, the latter end of August, system is, that charging the ox for his agistment for early seed the next spring for the ewes and the first year, for the value of the grass and turlambs; the remaining 20 acres are planted with nips the last year, and putting what he has in potatoes, and the whole came round for turnips three intermediate years as an equivalent for his the next year.

"Sheep running in the park, improved the farm very much; a great part of it when he commen-instance does a horse produce so much? ced would produce nothing at all, recently it yielded a clear annual rent value (or with crops) of more on stony land—they are all worked at Windsor in ry to their being hoed. The drill roller also, it

a period of less or about 9 years.
"Oxen are considered greatly profitable and infinitely more valuable than horses for all the purposes of the farm. He consequently exploded the use of horses altogether. He worked not less than 180 head of oxen on the two farms, parks and gardens; upon the two farms 200 were kept, including those coming on, and those going off-40 are brought in every year, rising three years, and are kept as succession oxen in the park, 120 are all excellent in their different stations.

are under work, and 40 every year are fatted off, "Train oxen thus: first put round their necks are under work, and 40 every year are fatted off, rising 7 years.

"The working oxen are mostly divided into teams of 6, and one of the number is every day the ox draw it about as he feeds about the pasrested; so that no ox works more than 5 days out ture, for three or four days, before he is put into growth of at least 5000 bushels of oats and beans, of the seven. This additional day of rest to the animal is of great service indeed to him, for he is found to do better with ordinary keep and moderate labour, than he would do with high keep calculated to be the average profit of an ox, stating and harder labour. This is the great secret to them to be bought in at £10, and allowing them learn respecting oxen; for an ox will not admit to sell for £25, taking off £10, for the two years of being kept in condition like a horse, artificially they are not worked; but last year, beans being

INDIAN CORN

Eastern Neck, Kent County, Md. June 20, 1822. J. S. SKINNER, Esq.

Having derived much valuable agricultural information from your useful paper, I conceive it incumbent on me in return, to communicate to my brother farmers, any improvements or discoveries, in my experience to facilitate the operations of farming.

Much has been said in your paper, upon the subject of gathering and securing the crop of Indian corn. Some writers recommend cutting down close to the ground, with the stock, blades, which cannot be dispensed with on farms that Another objection is, that the blades below the ear will decline, before the corn is sufficiently ma-

The plan I have pursued for two years past in securing my corn, I am so well satisfied with, that I never expect to abandon it. It obviates the objections to the system of cutting down, and is in my estimation, infinitely preferable to the usual method of gathering corn. My object in writing

ment was made which answered extremely well, to this warm fold, where the usual quantity of usual way. The stock, with the ear and top, is

ers' knives, having square wooden handles, the answ r for strong tenacious soils." same as we would cut tops with in the usual way, fixed at right angles in the lower end of a stick, the thickness of a hoe handle, and about three feet long; or, to shew the instrument on paper thus: cut the stock close to the ground with one hand, make our climate well known; and we all owe holding it in the other, and when the holding hand to our country to throw our mite into the genebecomes full of stalks, they are thrown crossways ral mass of knowledge. the furrow, like tops when cut as usual, each cut- "I recollect what I once told you about Barter taking two rows, and then throwing together rilla Salsola,* viz: that the culture of that plant formation from a correspondent, it is at your seracross the furrow the middle one walks in. Hands follow the cutters, to stack their corn, which is done by sitting it up with the bulk end of the common process for rendering them fit for cultook a little further cut then the term that the term of the common process for rendering them fit for culstock a little further out than the top, two hun-ture tedious and expensive; but Barilla will dred and forty hills in a stack, or twelve hills by grow well there, and, after two or three crops, twenty apart. I find this to be about the right size for a stack in the field to stand without quantity of salt contained in those marshes; for, tying, and to cure well. By the time a whole it has the property of decomposing and abfield is cut down and stacked, the first cutting will be cured enough to haul off and put in larger stacks, one cart load to a stack, made in the same way as in the field. I make my stack yard adjoining my feeding yards; and as the cornis husk-the United States, a quantity of land of that the same where the united states, a quantity of land of that the same wheels, which the conical wheels are equally liable to. He says, that cylindrical wheels, when the United States, a quantity of land of that the says, that cylindrical wheels, when the conical wheels where the conical wheels when the conical wheels where the conical wheels when the conical wheels where the conical wheels where the conical wheels where the conical wheels where the conical wheels when the conical wheels where the conical wh ed out, the stacks are put in ricks, to be fed to the description which could thus easily be turned to going on the centre of a curved road, press on the cattle during the winter. These stacks will stand the most useful culture, and which is now waste and the whole winter, and the corn is as good as if in useless to the owners even in the most favourathe corn house. But it is unnecessary to let them ble situations." stand, for you may husk them out before your neighbours are done gathering in the usual way.

The advantages I find in this plan are these: that I can cut and stack my corn in the field, as soon as I can secure my top fodder after pulling blades; corn and hoeing, in seeding wheat among the stalks can draw the corn off the field before the seeding ploughs, and stack it where it is to stand, and be husked out; that I have double the corn provender for my cattle obtainable in the old way of gathering corn, and can make more than double the quantity of manure; that my corn is gathered and secured by the time I have failed seeding to them so uncomfortable that they will very soon and secured by the time I have failed seeding to them so uncomfortable that they will become so affect. They will become so affect. that the hands that would be employed in sitting up and secured by the time I have finished seeding and that many will become so affect. I use are four feet six inches high, and six inches wheat, that I have no occasion of carting over my wheat, that I have no occasion of carting over my the tar getting on their eyes; and will run at dicular, or at right angles to the axle, the other is any of it left covered up in the ground in seeding wheat; and finally that my corn is sounder, heavier, and reputed the best corn that is carried to the Baltimore market, since I have adopted this plan.

I am Sir, your's, &c.
JAMES RINGGOLD.

P. S. I omitted to state that I consider my wheat crops to be better, on account of the wheat being better put in, and no carting on it Selections from late numbers of the London Far-lution the wheel makes, the outside must drag after the corn is removed.

J. R. | Mers' Journal, received at the office of the mation on this subject. I would recommend after the corn is removed.

Extract of a letter to the Editor, from a respectable farmer, dated near Beverly, Yorkshire, Enlgand, 7th March, 1822.

ON WHEELS.

Alconbury, May, 17, 1821. SIR,

The remarks of the Leicestershire Farmer in your Journal of the 14th current, have induced conical wheels press with a flat surface on a level road as the cylindrical wheels, they must press in the same way on all roads as the cylindrical wheels. As to his experiments of the two Take one or more (of either) alive, and baste, wheels laid down on their sides; it is a position I or wet it or them well with a mixture of about never wish to see mine in and can have nothing to the centre of the fellies, as the others: conical wheels of the same dimensions, say the diameter I am yours, &c. of the inside is four feet eight inches, and out-GIDEON DAVIS, Manufacturer. side four feet four inches, the circumference of the outside must be one foot less than the inside; therefore it is quite evident, that for every revolution the wheel makes, the outside must drag mation on this subject, I would recommend them to read Dr. Brewster's remarks on wheel carriages, in his Appendix to Ferguson's lectures on mechanics, published in 1806. As I flatter

Your obedient servant,

The remarks quoted as being made by the Leicestershire Farmer, were added by the Editor. We admit that the case in this is similar both ways; but why should the Bill assume that the teral pressure. We are glad to hear that he is going to Holkham, where all that is useful and meritorious is meritoriously encouraged, and where claims of this sort are advantageously discussed.

We therefore say no more on the subject in this place. Our correspondent will observe that we have omitted his remarks on the duties necessary on foreign corn; which although very sensible and correct, come too late to be of any service.

Edit. Farmer's Journal.

ON THE SUSTENANCE OF THE POOR. Essex, May 14, 1821.

observations. This person expresses himself as

point out the most prominent feature of his letter, of the greater part of the continent of Europe, or the hardy and robust natives of Scotland and wheaten bread and animal food, who, through could not have availed themselves of the advanwant of employment, may become objects of re- tages of heavy lading, and exemptions from lief, or whose large families may render their weighing. earnings inadequate to their support? It has been stated, and I think rightly, that want of means of consumption is a most operative cause of the depressed prices of agricultural produce: if all the paupers in England were denied the use known in this place before, attracted the attenour correspondent Hopson, on the colouring of tion of a numerous assemblage of spectators. A Scarlet. It will be found a valuable article, tion would certainly be again very much diffinished. Probably two thirds of the labouring poor bour, to Canty Bay, a distance of two miles and, in England are at present more or less paupers. Can J. H. wish English labourers, becoming paupers, through large families or misfortune, to be fed as the poor are in Scotland, on oat and barley of an hour and a quarter, gross time, being upmexture. The whole performed without this country, and such a publication, at a time work of six miles, the whole performed without this country, and such a publication, at a time mode I think would not be polite; and I beg to invention is entirely that of a respectable mill-all directions, is a great desideratum. The ta-ask, if it would be humane? The transition wright here, who expects a patent before he publication and experience of Hopson justify the most from bad living to good is very easy and pleasant, lishes the means of impulsion. but to decline from good living to a mere existence, is heart-breaking and miscrable. In such MATCH TO DO ONE HUNDRED MILES a case, would there be any encouragement to grow wheat or rear stock? Why do we get so For this reason because the majority of the in- a stake of 200 guineas. The pedestrian had on that subject. I shall take the liberty of rechabitants cannot afford to use them. Gerard who wrote his History of Plants about seventy years after the introduction of Pippins, Joel, where he declareth the destruction of the tional importance, affording an agreeable and has given no account of this variety of the apfruits of the earth by a long drought, mentions wholesome diet, in a thousand shapes, to all class-ple. He describes but seven kinds : the Pome Water, the Baker-ditch apple-the king of apples, the Quining, or Queen of apples, the Summer Pearmain, the Winter Pearmain, and "after the country from whence they were first brought in old times." Others were called chiro-in Fuller's words, "brought them from over sea," ples, he says, "The fruit of apples do differ tica, from Epirus, their native country; and that these were the same species of fruit that we small village on the north side of the South covered with a red skin, others yellow or call apples at this time, there can be no doubt; Downs, near the Devil's Dyke. Maschal brought greene, varying infinitely according to the soyle as they are described in Pliny's Natural History the first carp to England, and thus, at one time, and climate; some very great, some little, and as a fruit that hath a tender skin to be pared off; furnished our orchards and our ponds with the many of a middle sort; some are sweet of taste, ler; "and for their harsh sourness, they have,"
says he, "many a foul word and shrewd curse given them."

The Golden Pippin is a native of Sussex, and tweene sweet and sour; the which to distinguish, I think it impossible, nowithstanding I heare of which is also situated on the north side of the one that intendath to write the standard of the one that intendath to write the same of the one that intendath to write the same of the one that intendath to write the same of the one that intendath to write the same of the one that intendath to write the same of the one that intendath to write the same of the one that intendath to write the same of the one that intendath to write the same of the one that intendath to write the same of t Apple-trees, from the earlier accounts, seem to have required the fostering care of man. Of all the fruit-trees in Italy, Pliny says the apple is the tenderest, and least able to bear heat or cold, particularly the early kind that produces the translation of the English name.

Which is also situated on the north side of the one that intendeth to write a peculiar volume of apples, and the use of them." This author continues, "The tame and grafted apple-trees are planted and set in gardens and orchards made for that purpose: they delight to grow in good and fertile grounds. Kent doth abound with apples are provided in the continue of the English name. Catherine, Empress of Russia, was so fond of of most sorts; but I have seen in the pastures was of the highest value among fruit trees with this apple, that she was regularly supplied with it and hedge rows, about the grounds of a worshipthe Romans: "there are many apple-trees," from England; and in order that she might have ful gentleman dwelling two miles from Hereford, says Pliny, "in the villages near Rome that let for the yearly sum of 2,000 sesterces," which is parately enveloped in silver paper before it was sortes, that the servants drink for the most part no other drinke, but that which is made of ap-

We have in our or that they had not been cultivated out of Sussex, aithough I find Gerard must have seen the fruit of the Pippin kind, for in his account of the Pomum Amoris, or Love Apple, he says it is the value, being preferred before every other apple bigness of a goose egg or a large Pippin. The this country produces." While my namesake of Pippin appears to have been scarce even in the Pippin appears to have been scarce even in the time of Charles the First; for in the valuation of the fruit-trees at the royal gardens of his queen

at Wimbleton, there is only one pippin-tree men-

For some years past, it has been stated by several ingenious writers that many of our best varieties of apples could no longer be cultivated with success; that by length of time they have become degenerated and worn out. Mr. Knight, the president of the Horticultural Society seems to have been the first that gave birth to this idea. He says, in his Pomona Herefordiensis, that those apples which have been long cultivated are on the decay. The Redstreak and the Golden Pippin, can no longer be propagated with advan-tage. The fruit, like the parent tree, is affected by the debilitated old age of the variety. Again he says, in his Treatise on the Culture of the Apple and Pear, page 6, " the Moil, and its successful rival the Redstreak, with the Must and Golden Pippin, are in the last stage of decay, and

the Stire and Foxwhelp are hastening rapidly af- disclose the ingenious method he has adopted to blossoms are then closed again, as in Fig. 1. and "It is much to be regretted," says Speechly, "that this apparently visionary noshould have been promulgated by authors of res- and satisfaction in stating, that, after an unprejupectability, since the mistake will, for a time at diced research, I find this wonderful discovery least, be productive of several ill consequences."

real Golden Pippin in a perfect state, I was indu-cient world in this science. ced to make particular inquiries respecting this fruit; and have received satisfactory accounts of Arts, and who looked into nature with a most on which the prepared blossoms are, with a thin from all quarters, that these trees are fast recovering from a disease, or canker, which appears it was impossible to cross the breed of plants, keep off the sun or air, but to prevent the bees to have been brought on by a succession of under the bees and so procure kinds, by art, as novel as those or other insects from inoculating them with the propitious seasons; but that the summer of 1818, which nature has sometimes produced by acci-pollen of other blossoms, which would make the

most infinite variety of character, which is met with in the human eye, and which is in man, produced from the habits of society, and the various modes of life to which he is exposed.

"The uniformity in the appearances of diseases in the Eye of the Horse, makes the treatment of them the more simple, less of that nice discrimination being required in treating individual cases which is so essentially requisite in the practice of physic.

ably displayed. The preliminary remarks to be observed, that not only the progress of the are very judicious, and from this division of the diseases, but their treatment, must vary, accorsubject we extract our present article; adding ding to the different circumstances under which such remarks on the passages selected as are suggested by the reasoning.

adding to the different circumstances under which the animal is placed; or as it is in common language called, the 'Condition of the horse.' It suggested by the reasoning.

"A taste for pursuits of this kind among memay therefore be proper to observe, that there are four different states of condition, in either

" The second, when his food is more nutritious, and in that state of condition he is usually kept in by the agriculturist.

"The third, when he is living on dry food,

"The fourth, in the highest possible state of condition when the food is in the least bulk, the The author here refers to Mr. Cline's excel-body warmly clothed, the horse confined in a lent paper on the Form of Animals, to which hot stable, and exposed to the most violent bodi-

The peculiar advantages of this system are, diseased animals, might be especially improved disease, yet that treatment must be pursued in wound of equal severity."

"It is a common observation, that when one eye is attacked with any disease, the other is very apt to become affected with the same complaint. This sympathy observed between the two eyes, has been noticed in all those organs of animals of which there are a pair, and as shall afterwards be observed: a knowledge of this fact leads to important practical conclusions.

" Another question worthy of attention in considering the diseases of the Eye of the Horse, is, to ascertain how far any of these affections are hereditary. There is no doubt, but that every race of animals inherits the bad, as well as the good qualities of the parents; and that in breeding, imperfection, and deformity may be as successfully propagated, as perfection and beauty. This has been established beyond all controversy, and it is well known, that in mankind, families are not only subject to particular diseases, but in every race, one or more organs of the bobody are less perfect in structure, and functions, and more liable to disease. Numerous facts may be brought forward to establish the truth of this observation; but is sufficient for the present purpose to remark, how often it happens, that in one family many of its branches are affected either with diseases of the lungs, or brain, or liver, or stomach. Some diseases of the human eye are also known to be hereditary; it is, therefore to be expected, that the Eye of the Horse shall be defective, and more liable to diseases in particular races, or as it is usually desame time these diseases do not assume that alers of horses are familiar with this observation, and its coincidence with similar facts in other organs makes it worthy of attention. It is well. known, that some particular lines of blood are subject to spavins; others to curbs; and others to diseases and imperfections in the form of the feet. In corroboration of this opinion, it may here be mentioned, that a mare of the Mercury Blood, belonging to the Royal Stud at Hampton Court, who had lost one eye, had last season a dead foal, which had a single eye; scarcely any vestige of the other being perceptible. Several of the produce of Treasurer, a son of this mare, have been foaled with defective eyes.

"As has already been observed, the diseases of the Horse's Eye are not numerous, and it is here proposed chiefly to consider those causes of blindness which are most frequent, and on which medical treatment has the most powerful influence."

FROM THE CODE OF AGRICULTURE.

"Mr. Wigfull, senior, of Sheffield, recommends, that twenty-four bushels of the refuse of kiln-dried oats, (called shudes in Yorkshire,) or the same quantity of very dry sawdust, or any other substance that will absorb a large quantity of moisture, (as fine earth in a dryed state,) shall be steeped for some days in putrid urine, and then mixed with eight bushels of soot, or of wood-ashes, and spread on the young turnips, as soon as they appear above ground; which he is convinced, will prove an effectual means of preserving them from the ravagas of the fly.*

* This appears to be the method alluded to in ral subjects. The opportunities of dissection in of treatment be always applicable to the same our last. It is not stated for how much land

"An intelligent farmer in the neighbourhood always thins or pricks out his turnips, as soon as they appear above ground, as they are cer-

" A very great improvement in the cultivation of turnips, in dry soils, without any mixture of above described; and an intelligent friend of clay in them, is, by applying a heavy roller to mine, who farms in that county, has assured the turnip drills, instead of the light ones comme, that it has succeeded on alternate ridges; and soils, as Mr. Rhodest very properly observes, monly used. The reasons are obvious. The that the fly was destroyed where the burnings where it would be desirable to cultivate turnips, soil being thus compressed, moisture is retained in it, and the gaseous effluvia, arising from the decomposing putrescent mass below, which nourment, the crop was ruined.

Where the would be desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and where very strong measures, for the desirable to cultivate turnips, and the greatest turnips and turnips turnips and turnips turnips and turnips turnips are turnips. ishes the plants when young, not being suffered to escape too rapidly, which is often the case, their growth is promoted, and quickened. The from them that benefit to which his industry so soil, also, being rendered perfectly smooth, the justly entitles him. little vermin have no hiding places in which

they can sheiter themselves.
"Mr. Church, of Hitchill, an eminent farmer in Dumfriesshire, has ascertained, that it is the best mode of securing an early and regular moist dung, as soon as it is spread in the drills, and afterwards to cover the dung by the plough, but not quite so deep as usual. This practice and 4 Improving its active in the drills and active in the drills and afterwards to cover the dung by the plough, but not quite so deep as usual. This practice and 4 Improving its active in the drills, and active in the drills, and afterwards to cover the dung by the plough, but not quite so deep as usual. This practice and 4 Improving its active in the drills, and afterwards to cover the dung by the plough, but not quite so deep as usual. This practice and 4 Improving its active in the drills, and afterwards to cover the dung by the plough, and afterwards to cover the dung by the plough, but not quite so deep as usual. This practice and 4 Improving its active in the drills, and a is highly useful in dry soils and seasons, and and, 4. Improving its culture. should never be neglected (as the expense of the seed is so trifling,) where there is any risk of lo-sing the crop for want of moisture. In a dry season, when the globe and the Swedish turand the crops, after all turned out but moderate, the turnips produced by this plan attained a great size, (from 15 to 28 lbs. tops included,) and many of them could not get larger for want of room in the drills.

" But the following is the most effectual method that has hitherto been discovered, to in-

sure the destruction of the fly.

" As soon as the ground is completely prepared for sowing the seed, let a quantity of stubble, straw, furze, dried weeds, heath, wood shavings, or any other sort of cheap inflammable matter, be spread upon the surface, and burnt upon the ground, moving the flame forward, from time to time, and managing it, if possible, so that the smoke shall spread over the field. This is easily done in those dry seasons, when alone the fly is to be dreaded. As soon as that operation is completed, the seed should be instantly sown. -The flame and smoke either kill the insects, or compel them to take shelter, if any crevice can be found in the soil, where they remain until the young turnips are out of danger. The heat also, thus applied, and the ashes thus produced, are of some use to the crop. Nor does it require a great quantity of combustibles to go over the field, merely for the purpose of destroying the vermin, by the heat, the flame, and the smoke. It is probable, (though the quantity has not yet been ascertained,) that from one to two tons of stubble or straw would be sufficient. The security of a crop of turnips would surely be cheaply purchased by such a sacrifice; and if stubble is used, the object can be obtained almost without expense.

twenty-four bushels of sawdust, and eight bushels of soot, are to suffice .- EDIT.

of Edinburgh, (Mr. Johnstone, of Hill-house,) the surface of the soil, as a means of manuring sure, prevent the ravages of that destructive init for turnips, has long been practised in the tain of being in the rough leaf next morning, it has been employed for the express hurhose of climate as that of Holkham, for it had long and consequently out of danger.†

"A very great improvement in the cultivation The articles employed are burnt in the manner shire, but in Berwickshire, the Lothians, Northof turnips, in dry soils, without any mixture of above described; and an intelligent friend of

"It is earnestly hoped that the dilligent farmer

HINTS TO PREVENT THE FLY IN TURNIPS.

"To prevent the ravages of this insect, various modes have been recommended, which may

"1. To destroy the fly, it has been recommended, to roll the land at midnight, while the dew is on the ground, by means of which these insects may be crushed against the moist earth.* Boards have been smeared with tar, and drawn across nips did not vegetate till a month after sowing, the land, for the fly to skip on them, and be caught; and a trap has been invented, by which considerable numbers have been taken ;-trainoil, and sulphur, have been used with the seed. Quick-lime has been often suggested; and lime saturated with ammonia in the preparation of gas, has been accurately tried; but all in vain.
"2. To render the turnip less attractive

quick-lime has been used, sown when the dew was strong on the plants. The ground has been brushed with the leaves of the elder tree. Turnips have been sown in the furrow, as well as on the ridge; and radish seed has been used in small quantities, the turnip-fly being particu-

larly fond of the raddish plant.

"3. The growth of the plant is quickened, by the application of a proper quantity of suita-ble manure, and placing it immediately under the plant. And,

4. The culture of the plant is improved, by sowing a great quantity of the seed, (about three pounds per acre;) also by carefully weeding the crop, and frequently stirring the soil."

The distinction between quickening the growth of the plants, and improving their culture, is not very obvious. Our Norfolk correspondent F. observes, that with a fine tilth, and the land not very recently manured, he has rarely suffered any serious injury. This remark is satisfactory for two reasons; first, that in the broadcast way it suggests the benefit of early manuring, that the material may be thoroughly mixed and covered; and second, it explains and justifies the success of the ridge-system, because by it the manure is certainly covered, though recently applied.

"It is well known, where attention, has been paid to the means of quickening the growth, and improving the culture of the plant, that the fly is not to be apprehended. The plan of cultivating turnips in ridges, as originally practised by Mr. Dawson, of Frogden, in Roxburgh-shire, and now established with so much suc-

the mischief.

"The practice of burning straw and gorse on cess at Holkham, will certainly, in a great measect:-but it is quite a mistake to suppose, that Wolds of Lincolnshire. In Dorsetshire, however, the plan is only calculated for such a soil and it has been employed for the express purpose of climate as that of Holkham, for it had long truction of the fly, would be of the greatest utility. It is, doubtless, a fair field, on which chemistry may exercise its powers; at the same will avail himself of these hints, and will derive time, if security can be obtained by simple means, it would be more desirable.

"In looking over my notes on this subject, I find that other methods have been resorted to, for protecting the turnip crop, besides those enumerated by Mr. Rhodes.

"Some have recommended taking the seed of the same year, and of a former year, and mixing them together. Then to steep one half of the seed, thus mixed, in water, for twenty-four hours, and then to mix the whole together. By this previous management, the turnips will rise ut four different periods; and though the fly may destroy some of the plants, there will yet re-main a sufficient quantity for a crop, more espe-cially if the quantity of seed used, is at the rate of about three pounds; per acre."

CODE OF AGRICULTURE.

In treating of the Diseases of Wheat, Sir John Sinclair quotes an authority in p. 420, in which some experiments are stated to shew which sorts of wheat in common use, are most in danger of this distructive malady. The result is rendered obscure by the fault of the author referred to in the note, or by the customary haste of writing without points, on a subject in which the printers are not able to discriminate. The experiment was made in Torney Fen, in the year 1819. for the purpose of noticing comparative produce, quality, disease, and value of varieties; and especially to observe which sort would appear best adapted to the fen-lands; not the outside, but the middle of the field was chosen, and the soil was black mould, a little shallow, and mixed with poor clay. We copy the result verbatim from the code, for the purpose of correcting the errors of the press.

"1. Hungary white, or chitty wheat, short strawed red. These were nearly free from mildew, and were superior in the order in which

they are placed.
"2. Square-eared white, velvet white, or eggshell, were pretty good, but diseased.

"Old red lammas, (awned and smooth,) Sussex thicket hedge-row. These were much worse

mildewed; they are all red wheats.

"Talavera-Cape wheat. These were almost good for nothing; not merely with the mildew,

but partly owing to the May frost."

The meaning of the above is—1. That the Hungary white was the freest from mildew, and the best in quality; next to this was the Essex white (or chitty wheat;) third, was the shortstrawed red.

2. The square-eared white, and the velvet white (or egg-shell wheat) were pretty good, but dis-

eased.

3. The old red Lammas (both varieties.) The Sussex thicket and the hedge-row wheat (all of them red wheats) were much worse mildewed.

See Farmers' Journal, 28th July, 1820. This word in the Code, is unfortunately printed bushels.

[†] This direction we consider as unfortunate; if the crop could be saved this way, there would be no need of any further inquiry. We grant that stirring the surface, and repeated hocings, accelerate the growth, and disturb the depredators; but it cannot be that turnips pricked out the day they come up, shall be in the rough leaf the slug, to which he erroneously attributed the the next morning.-EDIT.

4. The Talavera and Cape wheats, were very bad; the latter had no wheat in it.

perior to such lapses or oversights; but for the sake of those who gather their notions of agnation found them, many as above described, but how then good Sir, if you, or any of your intelligence principally from reading, and also of by far the major part containing a small grub, riculture principally from reading, and also of those agriculturists who may be unacquainted which I have very little doubt to be the grub of their numbers in any considerable degree, before with some of these sorts, and may wish to try with some of these sorts, and may wish to try them, we have thought it needful to insert these corrections.

ON PREVENTING THE RAVAGES OF THE TURNIP FLY.

North Creek, Burnham, Norfolk, June 9th, 1821.

SIR.

Many experiments have been tried to prevent the flies from destroying the young Turnips, and I have tried several myself, but have found none so effectual as early horse-hoeing them. Mr. Coke stated at his meeting last year, that by his early horse-hocing he had saved his from their ravages. I immediately horse-hoed mine, that were then covered with flies, and in a few days, I believe, would have been all destroyed. I re-dies for destroying the Turnip Fly; and in addicommended a friend of mine to hoe his, that were tion, I beg leave to present to your notice a remesown the same time as mine were; he said he dy I have practised at different times when anthought them too young, he would therefore wait noved by these destructive little insects. I have and Ireland for the last ten years :a few days till they were a little larger; he did been a turnip grower for these last twenty-five so, and they were all destroyed, (forty acres;) the ground was then ploughed, and sowed with white Turnips; while my Swedes were saved, I believe, wholly by that means. I now write to state a similar experiment this year. I drilled the swedes on the 12th May last; on the 26th daily these destructive little insects. I have a few days till these destructive little insects. I have a few days till these destructive little insects. I have a few days till these destructive little insects. I have a few days till these destructive little insects. I have a few days till these destructive little insects. I have a few days till the section of the my swedes on the 12th May last; on the 26th ed into a powder, I cause it to be sown carefully in 1796 it had risen to £328,000,000; and in 1806 horse-hoed them, on the 29th horse-hoed them upon the young plants. If any farmer will try to near £608,000,000. again, and this day, the 9th of June, horse hoed this simple remedy, his turnip crop may be saved them a third and last time: they grew rapidly affrom the destruction of the Fly. Immediately ter the two first hoeings, and will be cross-hoed after rain, or while the dew is on the turnips, is 20 guineas to go sixteen miles in two hours, on a on Monday next by hand,—fine plants. A neighthe best time for sowing the lime, when it adbour of mine who had sowed his the same time heres to the leaves of the young plants. mine were, I advised to hoe them the same time If you consider these hasty remarks worthy of minutes and a half within the given time. 200 TO THE EDITOR OF THE AMERICAN FARMER.

July 9, 1822.

DEAR SIR. Your printer has made of my letter (page 118 of this vol.) arrant nonsense:—instead of "Bark, shells and sea marl," I said, as plainly as possible, that the improvements were effected by bankshells and sea-ware. The sea-ware is, by cor-ruption, generally called sea-ore, (see Rees' Cyclopedia, where it is also called sea-wreck, seatangle, and sea-weed.) Many improvements of the soil have been made in Talbot by shell-marl, (decayed cockle shells, &c.) but the shells I alluded to, under the term "bank-shells," are oyster-shells, which are found on the margins of our creeks and Rivers, supposed to have been left by the Indians, and are now nearly decomposed, and make an excellent manure.

Instead of "the facts on the shot," I am made to say "the tracts and the shot," there are other trifling errors, which I do not regard; but those I have pointed out are too provoking to one who wishes to preserve the reputation of common sense to pass over in silence, pray correct them.

It has been thought best to publish the above, although the errors complained of were all corrected before many papers had left the press.

Editor American Farmer.

PHILADELPHIA AGRICULTURAL EXHI-BITION

The committee on househould manufactures at the late agricultural exhibition near this city, offer the following report, and award and recommend the following premiums:

1. To John Philson for 30 yards of brown linen

2. Mrs. Rachael Fish, of Philadelphia, for 26 mixed woollen and cotton counterpanes, the ma- the Loudoun Sorrel, was twenty six seconds, at terials spun and dyed in the family; and has also the rate of one hundred and four seconds to a

3. To Dr. Rose, of Montrose, Susquehanna ter before she could be removed to her residence county, for 120 pounds of fine maple sagar, equal at Liverpool; and she is not yet recovered from to any brown sugar imported, the only sample of-the effects of her injuries. She was in a state fered, 8 dollars. [There being no maple sugar made in Philadelphia county, it was resolved,

The following articles were also exhibited.— They were not included among those specified for

1. To Archibald Campbell, for 25 yards of lin-Charles Coon took his passage in the stage at en drilling of excellent quality, of three dozen yarn, 10 dollars. [A. Campbell has also made 600 yards of the same quality drilling, some of which wheels came off, and the stage was overset, full and partly by women hired by the "Female Hos-

> 2. To William Latham for two counterpanes, of mixed woolen and cotton, 10 quarters wide,

3. To Mrs. Sarah Sproul for a carpet of patty-pan figure, made of scraps of coloured cloth,

4. To Mrs. Hannah Johnson, for a very elegant

needle, 5 dollars.

5. To Mrs. Parker for a substantial woollen carpet, Turkey pattern, and needle worked, 5 dollars.

Mrs. Jeremiah Warder, Jr. sent a number of handsome fine napkins and table cloths made in her family; these had been some years in use. Miss Sophia Elliott sent a handsome cotton

counterpane.

Miss Sophia D'Autrichy sent a bush containing a number of silk worms forming Cocoons, several pounds of which she last year raised.-The committee regret that this branch of domestic iudustry is not more attended to by the families of our farmers, and recommend the example of Miss D'Autrichy to their imitation.

Mr. M'Cauly sent specimens of his manufac-

1 Cotton oil cloth.

do. on baize.

3 Linen oil cloths, all very smooth and plia-ble. The composition of the latter is improved: the article is in use for carriage curtains: it does not require greasing, and does not harden in the sun, and is hence particularly calculated for a southern climate.

Messrs. Rankin and Fowle, sent two very fine specimens of their beaver hats, and Mr. Woolworth several light and neat cotton hats. These articles did not properly come within the notice of the committee, but are mentioned from the satisfaction they gave the members

destitute of grain; and that this influence is great, that even the birds refuse to eat it.

thorny bush called appendix, having red berries hanging from the branches which were called appendix and accorns that their island afforded.

An oil equal in flavour to the location. hanging from the branches which were called any findices: An oil, equal in mayour to the best only findices: The bramole derives it's from the redness of the twigs and juice of the themselves, or dried, and boiled in wine, are good becoming rancid, may be obtained from the nuts from the redness of the twigs and juice of the twigs and juice of the becoming rancid, may be obtained from the nuts fruit. Pliny informs us, that the propagation of the twigs are target to the propagation of the twigs are the propagation of the twi salad, and to season meat with: he also says, in Silesia, it is used by the country people in-"The green leaves of the barberry-bush stamp-stead of butter. The cakes which remain from procureth appetite."

Barberries are of an agreeable, cooling, astringent taste, which creates appetite. A conserve is made from this fruit that is refreshing, and strengthens the stomach, and is good against diarrhœas and dysenteries. 'I he juice, or decoction, abates the inflammation of the fauces and tonsils, and heals scorbutic gums .- Brookes.

Pickled barberries make a handsome garnish for all white dishes, where acids can be introduced: this fruit is also used for making syrup, lo-

zenges, &c.

The bark of the tree is a good medicine against the jaundice, and all obstructions and foulness of the viscera. The inner bark of this tree, with Poland it is used for colouring of leather.

We have now several varieties of the barberryshrub cultivated in England, one of which was brought from Candia in 1759, and another from Siberia in 1790; but it possesses no advantage over our native kind of this fruit.

BEECH.-FAGUS.

A Genus of the Castanea, or Chesnut Tree, and of the Class Monæcia Polyandria.

Monogynia.

The beech is one of the handsomest of our native forest-trees, which, in stateliness and grancultivation this kingdom is now arrived at, it is still to be found growing wild in many parts of the northern counties. Gerard says, in his time in the territory of Tusculum, not far from the (1597) most of the hedges near Colnbrook were city of Rome, that was clad and beautified with He their first appearance have a perfume similar to beech-trees, of such beauty, that Passienus Cris-

ter from beech-nuts.

The finest beech-trees in England are said to grow in Hampshire. The forest of St. Leonard, near Horsham, in Sussex, abounds with noble beech-trees. The cottagers of this forest inform you, that when St. Leonard wished to rest beneath these trees, he was disturbed during the day by the biting of vipers, and that his repose was broken in the night by the warbling of nightingales, and on that account they were removed by his prayers, since which time tradition says of this forest,-

The viper has ne'er been known to sting, Or the nightingale e'er heard to sing.

The shade of the beech-tree is very injurious to most sorts of plants that grow near it, but is generally believed to be very salubrious to human bodies. The leaves of the beech are collected a grove and tufts of Beech-trees, which were as in the autumn, to fill mattresses instead of flock even and round in the head as if they had been or straw, as they remain sweet, and continue soft, for many years. To chew beech-leaves is accounted good for the gums and teeth. The Romans used beech-leaves and honey to restore the growth of hair, which had fallen off in sick-

The timber of these trees, in point of actual dredge, Esq. of New Lodge St. Leonard's Forest, was causing fish-ponds to be dug in that neigh-bourhood, the workmen found scantlings of beech timber, and trunks of these trees, squared out, which were supposed to have been buried in the earth since the time of the Romans, as there is no record mentioning that part of the forest having been either cleared, or ponds made since .-The beech, it will be observed, from the class Beech-timber is subject to worms when exposed it is ranged under, produces both male and female to the air without paint. Resolved, That a copy of this report and re-solutions be sent to our Senators and Representatives in congress.

All which is respectfully submitted.

B. S. FORREST, Chairman.

ACCOMPANYING DOCUMENTS.

Letter from the Committee, to John Mason, Esq. President of the Potomac Company.

ANNAPOLIS, January 30, 1822.

DEAR SIR.

The committee appointed by the House of Delegates, on the subject of the improvement of the navigation of the Potomac river, are desirous of obtaining from you as President of the each share one year thereafter, and \$10 on each Potomac company, information on the following share annually thereafter. By this plan, the points.

ceived by the Potomac company, from 1st of five per centum per annum on the payments as August 1817, to the 1st of August 1821, they are made, until the last payment is made, together, with the number of boats and tonnage and then on the whole for the term of ten years. employed, and the produce and merchandise employed, and the produce and merchandise The tolls which may be from time to time re-transported, with the estimated value of the same ceived on the works already made, and on those during that period, exhibiting the amount in which may be constructed during that period, each year; and from the 1st day of August, 1821, to be applied to the payment of the interest. to the 1st of January, 1822.

2. The number of the shares of the capital or dividing stock, and the amount.

3. The number of the shares and amount held by the states of Maryland and Virginia, and by individuals respectively.

4. The whole sum expended on the works from the commencement of the operations of the company, up to the 1st of January, 1822.

5. What may be considered the annual averthe works?

6. The amount of the debts due from the company on the first day of January, 1822, shewing to whom due, principal and interest.

7. Whether the stockholders in the Potomac Company would desire an incorporation into a new company, to be formed on a basis calculated to insure complete success to the improvement of the navigation of the Potomac river, and in which their rights should be preserved.

8. Whether the creditors of the Potomac company, in your opinion, would take stock in a new company, to the amount of their claims, as

payment of the same.

The committee would respectfully submit to your consideration, a rough outline of a plan which has been proposed to the committee, as quently occur, in the passage of joint acts by ments of the stockholders collected of late virginia, it is proposed that Congress and and years, as well in official, as individual in the late virginia, it is proposed that Congress and and years, as well in official, as individual in the late virginia, it is proposed that Congress and and years, as well in official, as individual in the late virginia, it is proposed that Congress and and years, as well in official, as individual in the late virginia, it is proposed that Congress and and years, as well in official, as individual in the late virginia, it is proposed that Congress and years, as well in official as individual in the late virginia, it is proposed that Congress and years, as well in official as individual in the late virginia, and years, as well in official as individual in the late virginia and years, as well in official as individual in the late virginia and years, as well in official as individual in the late virginia and years, as well in official as individual in the late virginia and years, as well in official as individual in the late virginia and years, as well in official as individual in the late virginia and years, as well in official as individual in the late virginia and years. the legislative head of the contemplated company. This appears peculiarly proper, as that bo-dy holds its sessions in the midst of the District ested in the improvement of the navigation of the Potomac river, and in which their rights should be preserved."

To the 8th: The creditors of the company getions for legislative enactments concerning the peralty. I apprehend could not be induced to the navigation of the first instance, would leave them to participate with the United States in the new stock on a different footing; and if the creditors of the company getions for legislative enactments concerning the preserved. of Columbia, which district is very vitally intercompany, can there be easily made, and promptly obtained. The states of Maryland and Virginia, can, by one act, confer the privilege on Most of the debt has been incurred, with the tions for legislative enactments concerning the this company of carrying on their operations in banks in the district, which being much redu

of said river. And if for that purpose, it will their respective territories. It is also proposed, ced in their business, could not, I presume, lay

1. A statement of the amount of tolls reThe United States to guarantee an interest of It is proposed to fill the blank in the subscription on the part of the United States, with five hundred thousand dollars, and the blanks opposite the states of Maryland and Virginia, each with two hunared and fifty thousand dollars, including their stock in the present Company, and including also the debts which may be due from said company to the said states.

asked for as you may deem of consequence to would agree to subscribe their stock at the original age amount of the tolls in the present state of aid the deliberations of the committee, is ear-par value, say £100 sterling per share, and give

With assurances of respect, the committee are sir, yours, &c.

B. S. FORREST, Chairman. JOHN MASON, Esq.

Office of the Potomac Company, } George-Town, D. C. Feb. 5, 1822. }

STR. I duly received the letter you addressed me to the affairs of the Potomac company; with which request, so far as depends on me, I comply with great pleasure.

Answers to the first six queries put by you,

years, as well in official, as individual intercourse given me, so far as to suggest some alterations in plete success to the improvement of the naviga- coming in as present stock-holders, to subscribe

If an interest on subscriptions is guaranteed by Congress until the profits of the works replace it by dividends from the tolls, at the rate proposed; then I think a subscription both of creditors and other individuals might be expected; but perhaps it would simplify the plan, and make the procuring the money cheaper, if congress would issue a stock, for say, one million seven hundred thousand dollars, bearing interest at 4 per cent, at which the money might be had, if not here, in Europe, irredeemable in any part for twenty years, and then to be sunk by payments of dividends of six per cent, per annum, including interest, and taking the guarantee of the states of Maryland and Virginia, to furnish annually to the public treasury, their quota, to say, for the stock that each might agree to take; let the present stock holders subscribe say the states and individuals, in their respective capacities, at par, giving up the interest to the amount of the now capital stock, i. e. \$311,555 55, their having paid the debts, there would be left something more than one million and an half to operate on, in the new project, thus:

Old Capital New Capital	\$311,555 1,700,000
United Capital	\$2,011,555
Money raised from new capital as above	1,700,000 175,000
Remaining to be expended	\$1,525,000

Which it is believed would make an independent canal with the requisite locks and towing Your opinion on the proposed plan, together paths from Fort Cumberland to tidewater. I with any information exclusive of such as is am induced to believe that the stockholders nestly solicited, at as early a day as your con-venience will possibly admit. up the 30 per cent advance paid on $\frac{23}{73}$ of it, to wit: on the subscriptions of 1796 and 1798 subscribed and paid as shewn in paper marked (B,) at £130 in lieu of £100 (the price of the first shares subscribed;) and moreover, to sink the interest on the money which they have laid out of from 25 to 35 years, and on account of which the sum of upwards of 200,000 dollars, as is shewn by the table (A) has actually been in hand and been re-expended in the work. A greater sacrifice than this could not be asked of those on the 30th ult. requiring information in relation who have borne the brunt of the battle; who have been contending with difficulties, and have advanced their money for about thirty years; and who have, as will be shewn by the first and last columns in paper (A) served the interests of the will be found in the enclosed papers as noted at community by cheapening and facilitating the carriage of about a half a million's worth of produce per annum, for the last twenty years.

Thus, sir, I have used the permission you have with such as reside in this part of the country, I your plan, the outlines of which, appear to me have no doubt but they would most cheerfully unite to be well calculated to answer the end proposed; with and make part of a new company to be lounded "on a basis calculated to ensure comnerally, I apprehend, could not be induced to company and individuals are not looked to, it

A plan not very dissimilar to your's is also now

maturing in a committee of Congress, so that I have great hopes that good will grow out of these various evidences of the interest taken in the navigation of the Potomac.

With very great respect,

I am sir,

Your most ob't serv't,

J. MASON

RENJAMIN S. FORREST, Esq.

Chairman of Committee of the House of Delegates of the Legislature of Maryland.

[17 See Table (A) at the end of the documents, which belongs here.]

The table marked (A) constitutes an answer to the 1st query, and the 5th, by giving a view of all the tolls, tonage and produce, from the commencement to the 1st of August, 1821.

Answer to the 2d Query.

The capital or dividing stock is made up of 701 shares at £100 sterling

\$444 44—\$311,555 55

Answer to the 3d Query.

The State of Maryland holds The State of Virginia holds Of which 70 were presented to General Washington,

Individuals hold.

361

Shares.

701

NOTE. The original number of shares subscribed were 730-29 of which were forfeited and merged in the remaining 701.

The original subcription in 1784, was for 500 shares at £100 sterling each; a second subscription was made in 1796 for 100 shares a £130 sterling each, and a third subscription was made in 1798, for 100, shares a £130 sterling each.

Answer to the 4th Query.

The whole sum expended on the works, in contingent expenses, and interest on the debt stated on 1st August, 1821, at \$700,000 nearly, (see paper C.) was supplied by the capital stock, by monies arising from tolls, loans, from interest received, and from forfeited shares.

Answer to the 6th Query.

The amount of the debts due from the company on 1st of August, 1821, the last period its accounts have been made up for principal and interest, was stated at \$174,390.

List of debts due by the Potomac company, to 1st August 1821.

put to rest by the judgment of the supreme judicature of the land; for the reasoning employed Therefore, to establish the decision in the case of the United Be it reso States Bank, applies with great force to this point. duty of the general government to effect these vantages which they would produce to the states, a national system of internal improvements. individually, compared with the benefits to them would secure to them as distinct sovereignties; but this gain would likewise prove the gain of the of its citizens—so the capital of the general gov-ernment, or in other words its resources would be augmented in proportion to the augmentation of state capitals. There are, however, other, and great considerations which enforce upon congress the duty of accomplishing these works. To promote the public welfare, it is the part of a wise government to adopt every means of drawing close the bonds of our Union. We think this cannot better be done, than by creating objects in which all have a great interest; and by strengthening our mutual dependence upon each other by affording facilities for exchange of products, and reci-procation of other benefits. We should thus lead the whole force of private interest, and convenience, to the abstract political truth, that in Union is prosperity. An extended inland commercial intercourse would further, (by removing the prejudices of local education) clothe our political connexion with all the attractions of domestic affections, and convert the cold union of political convenience into the warm hearted alliance of social sympathy and friendly sentiment.

It would be found a necessary and valuable auxiliary towards providing for the public defencea duty allotted to the general government.-It would enable the government during a state of ordinary and honorary member of the institudemand. Emergencies might, indeed, occur, and grow naturally out of the execution of the trusts reposed in it by the federal constitution .-Hence we are led to conclude that as the great that if subscriptions were admitted and receivby the local authorities, but by that government whose province it is; to superintend the general ing to exist on a reduced establishment, might, on the contrary, enlarge its sphere, and extend I hope that this piece of information will inobject, promising such beneficial results to the Kingdom: country, will be unaccomplished either from want as might attempt it, or from discrepancy of out the United Kingdom, to become honorary views where the concurrence of two or more members of the BOARD OF AGRICULTURE, as states is necessary. MR. MILLARD. Read Feb. 23, 1822.

Selections from late numbers of the London Farmers' Journal, received at the Office of the American Farmer.

BOARD OF AGRICULTURE,

32, Sackville-street, 24th May, 1821.

President:

THE RIGHT HON. THE EARL OF MACCLESFIELD. Vice Presidents:

The Rev. Geo. Jenyns, John Fane, Esq. M. P., extension and improvement Davies Gilbert, Esq. M. P., Chas. Duncombe, Signed by order of the Board, Esq. M. P.

The government having signified their intenthe support of this Board, it was proposed to provide, if possible, for the maintenance of the Board under its existing charter, on a reduced establishment, by donations, and by annual subscriptions of two guineas each, from every

question of constitutional power we consider as dence or practical utility .- To express the views advance, as an annual subscription for the current year, and yearly and every year shall continue to pay such annual subscription for every current year; and who shall afterwards be considered to be annual subscribers until notice of And it is ordered, that the Secretary do pubnational system of internal improvements.

Be it further resolved, That our Senators and in the Courier, The Farmer's Journal, and the County Chronicle; and that he do make the states in their separate or independent character, direct the attention of Congress, to the expedi-same known, by correspondence with such counthese improvements would produce one great ency of immediately providing for the opening try gentlemen as he may be acquainted with in result, an augmentation of capital, by enhancing the productiveness of labor. And this is the water to Cumberland in Allegany, and of conformal subscriptions the subscribers will be severy chief, if not the only important benefit that it necting by a canal, the waters of the Dela-rally entitled, not only to a copy of all the communications of the Board, which may be hereafter Be it further resolved, That the governor be published, but also to attend all such lectures as may be hereafter established and read at this Board; and above all, that this Board hopes, that by a large and extended subscription throughout the United Kingdom, to continue not only the annual Cattle Show in London, which they had just commenced, but also their annual premium to the occupier of the best cultivated farm, which they mean to offer to every county in the United Kingdom, in which at least twenty subscribers to this Board shall reside.

That these important objects, together with securing and connecting a general centre of communication, and diffusion of knowledge upon all agricultural improvements, and breeds of cattle and sheep, cannot fail, in the opinion of this Board, to attract the attention, and receive the support of every man who traces the real prosperity of every state to its true source, viz: The extension and improvement of its agriculture.

> GEO. WEBB HALL, Secretary.

tion no longer to continue the usual grant for SIR JOHN SINCLAIR on the Destruction of the Fly in Turnips, by Flame and Smoke. George street, Edinburgh, June 2, 1821.

SIR, I have just received a letter from a friend, in

which there is the following paragraph:would enable the government during a state of ordinary and honorary member of the institu-war, to make a more prompt application of its tion; and a circular letter, signed by the President, ter, I had some conversation with Mr. Thomas means for internal defence, by creating facilities was sent to every such member of the Board, Green, of East Tibberton, in the county of Safor transportation, with comparatively little cost, requesting to be informed, whether or not he lop, one of Lord Stafford's most improving and cannon and other munitions of war, from one would subscribe that sum annually for the above considerable tenants, and one of the best farpoint to another, as the public exigencies might purpose; and adding, that a donation of twenty mers in the island; in the course of which he demand. Emergencies might, indeed, occur, guineas would be received as a subscription for stated to me, that the Fly, last year, was as during war, where the necessary aid could not otherwise be furnished. These are advantages subscriptions from such members have been reparts of England. He tried every means of desespecially resulting to the federal government, ceived, as to place the existence of the Board, troying it, such as sowing the seed with sulon a reduced establishment, beyond all hazard. phur, and with salt; also rolling in the night And it having been represented to the Board, time, &c. &c. but all without success. Having Hence we are led to conclude that as the great that if subscriptions were admitted and receivand prominent advantages of such a system are ed from the public at large, for the support of burning stubble, he tried the experiment on a of a general and not local operation only, the this most important of all national institutions, small scale, which was attended with so much provision for its execution should be made, not viz: The encouragement and improvement of success that he is determined to try it more ex-

aid of the general government, the great federal its influence to every corner of the United duce many other farmers to try the experiment on an extensive scale, and that they will com-It is therefore unanimously resolved, That municate the result to the public, whether faof means on the part of such state governments this Board will admit all such persons through vourable or otherwise, through the medium of your Paper.

I remain, Sir, Your very obedient serv't. JOHN SINCLAIR.

ON THE TURNIP FLY. Banks of the Tay, May 26, 1821.

SIR,

tions of the Turnip Fly. This communication their promises are often too sanguine,) because he has never furnished any material that can be adware published in the first volume of the Socie- is not the author of this plan. The above state- mitted as a substitute. It is a plant, which comthey are completely dry, otherwise the effect used in our experiment was not fresh Slaked .will appear as you have described in your judi- EDIT. cious remarks on that subject, contained in your valuable Journal of Monday last. To say nothing of the pernicious effect resulting from hot lime being applied to the wet surface of young leaves, that would be immediately formed would to-tally prevent any thing like perspiration from the upper part of the leaves, and though that might be the easier of belief. We have now crust might be quite impenetrable by insects, the minutes of the evidence before us, and it the application of the lime would extend in proportion to their growth; hence the yellow, sicky, and ragged appearance of the foliage, when in dry weather, none of these effects are produ- The evidence shews that the seeds to be bleachnever been seen to touch a plant while the dust kiln, on hair cloth, and fumigated with sulphur-vaneighbour, whose turnips in an adjacent field power to prove that not much heat is applied, neighbour, whose turnips in an adjacent near power to prove that not much near is applied, were in the same state, had commenced ploughing down for a second sowing; but, as the season was far advanced, (4th July,) and as, by splitting out the drills, I must have lost the use of the dung contained in their centre, for that the loss by expecting it to the acc. season, besides the loss by exposing it to the ac-tion of the weather, and time not permitting to or inferior seed, the purchasers are imposed on, and boys to work, with gloves on their hands, only chance a farmer has in sowing inferior seed, to dust over every plant that had any part of is to purchase a great deal for a little price, and would have done, had the dust been washed off dusted an acre, and the expense of sowing made public, &c. As this is not, at present, amounted only to ten pence; but it must be likely to be tried out of his own neighbourhood, are never sown broadcast; where that is the case, more lime may be necessary. You will no doubt rank me amongst those who make "large claims on public expectation," and I am willing to subject myself to any censure that you, or the public, may be pleased to inflict, on condition that the method I recommend will be first fairly submitted to the test of experiment, when the sun is near the meredian, or when the "morning dew" has passed away." I shall only add, that I have found soot quite ineffectual: it rather attracts than repels, the mischievous marauders. As you are already acquainted with first obtained.

Society, Edinburgh, on preventing the depreda- | pursuits, however, are meritorious, although dying of woolen, because the materia tinctoria

The woad plant requires a deep, rich, loamy much bran and madder; that which comes from land of middling quality may be used occasionally to vamp with, but when used altogether by itself the colours will be weak in body, nor will they stand the usual test of acids and exposure to the atmosphere. Woad that has been raised on good land, gathered in proper season, and skilfully attended during the manufacturing afterwards, will, in the hands of a good workman, make colours highly beautiful and very permanent; but its property, as might be expected from the contingencies to which it is subject is very valuable, and from hence arises all the difficulties which the dyer has to encounter, and the consequent disappointment experienced by the manufacturers of this country in the skill of European woad dyers.

To obtain a prime article of this kind, invariably the same in strength and quality, must be therefore, a grand desideratum with our dyers and manufacturers. To effect this objects, I have lately imported a small quantity of woad, now for sale at Messrs. Divie Bethone & Co. which is the best that the west of England affords, and if encouraged, I shall continue to supply the market at a reasonable price, until I can find some respectable landholder in the vicinity of New-York, who has ground of the quality wanting, and sufficient enterprise to undertake the raising and manufacturing of it in a regular and permanent way.

The woad vat is compounded of woad, indigo, regetable ferments, and of a caustic or sub-carbonated alkali: the woad acts both as a colouring and fermentative matter. There is a difficulty in attending the use of this material, arising from its liability to run into the putrefactive fermentation; whenever this happens, the vat is inevitably lost, and it requires considerable practical skill to pre-vent it. The vegetable ferments are usually bran by rains before the plants were out of danger.

We have received a letter, which we consiand madder, but the materials which may be used
der as somewhat extraordinary, from Mr. Joare very numerous, and every ignorant workman
to see every plant that had been on the verge of
shua Wigfull, sen. dated Sheffield, 13th inst., in destruction, show vigorous foliage, which ulti-which he states that urine, mixed up with ab-secret, when he has substituted some other mately produced a heavy crop, while my neigh-sorbent matter, (such as sawdust,) and two other result matter than the foliage of those. I have known weld, bour's second sowing shared almost the fate of ingredients, may be had gratis by application to his first, and what few plants escaped the fly him, to be sown at the rate of ten or twelve bush-swill, and many others applied, and as all of them were so late as to produce nothing but foliage. els to the acre, to prevent the ravages of the are vegetable ferments, they must produce a like The indigo is ground to a paste, and put into the vat together amounted only to ten pence; but it must be likely to be tried out of his own neighbournood, with the plants were sown in drills, we may wait the result before we say any thing has fermented, until the indigo is reduced to its minimum of oxidation, which may be known by with the woad, bran and madder; when the whole the liquor being of a green colour bearing a rich purple bede, and having copper scales on its surface, as much of lime is gradually added as will hold the indigo in solution. It will be necessary to replenish, as soon as a given portion of the al-ON THE WOAD PLANT AND WOAD kaline earth becomes saturated with carbonic acid gas, by adding an additional quantity of lime, and "The isatis tinctoria, or woad plant, has been when necessary, of vegetable ferments and indiused for nearly two thousand years, in dyeing of go. A good workman may keep one of these vats blue, and was the only material from which the in daily operation for six, nine, or even twelve Europeans obtained that colour, before the disco- months without any injury to the colour. It is very of South America, from whence indigo was this continually, together with the small quantity of ferment used, and the great beauty and dura-"The French, during the late war, being de-bility of the colour, which gives to the woad vat

THE FARMER.

BALTIMORE, FRIDAY, JULY, 26, 1822.

THE TITLE PAGE AND INDEX for the third volume of the American Farmer will be committed to the mail at the Baltimore Post-General Ringgold's communication is valuable, Office, along with our next number-that is, on

> Circumstances which it is hardly necessary, now to explain, have delayed the appearance of this Index. Owing to some untoward obstacles,

not to be foreseen, a long time elapsed before the work could be taken in hand. The desire to make it very full and satisfactory has increased the volume of it, much beyond what was anticipated; and thus retarded its final completion, until we fear the patience of our friends is exhausted. The consolation left us, is the hope that when in the course of another week it reaches their hands, compensation will be found for its delay, in the amplitude of its details, and the minuteness and accuracy of its references to every subject alluded to, or treated of, in any and in every page of the volume.

We have experienced that it is not prudent to announce, on all occasions, what we wish or intend to accomplish for the benefit or gratification of our subscribers; nevertheless, we may venture to advertise our respected patrons that, after the present half year, the Index shall proceed-pari hassu-with the work itself-each number shall be indexed as it is published, and thus each volume may goat once into the hands of the binder.

Prices of the following articles collected for the American Farmer this day.

Tobacco.—Fine yellow and red mixed—2 hhds. from Mr. Thomas Hammond, Frederick county, \$25 50 cts.—Fine red Patuxent, John Leach of Calvert county, \$12—Two from Benedict, \$12 —Good red, 38 to \$10—Common, \$5 to \$7— Best seconds, \$4 to \$6—Worst do. \$1 to \$2 50

GRAIN.—White wheat, none in market, \$1 25-Red, \$1 15 to \$1 20—White corn, 65 to 70 cts.-Yellow do., 63 to 68 cts.-Oats, 25 to 27 cts. -Rye, 65 to 70 cts.-Wharf flour, from \$6 25

JONATHAN S. EASTMAN

Respectfully informs Agriculturists and the publick generally, that he continues making the above Machines, and has now on hand a few of each size, viz: common size with a permanent bottom, capable of cutting 70 bushels per hour; price \$45-the same size, with a revolving bottom, \$50-and the large size, that will cut from Another letter dated Columbia Court-House, 90 to 100 bushels per hour, \$60. As the above veyor of this county-and his report was thirty- Geo. 11th July, says:- The rust has injured our prices may appear high, he requests persons one acres, including rock breaks, which he esti- wheat and entirely destroyed the fields in many wishing to purchase to call and see the machines, mated to contain one acre, so that it may be fairly places. POMARIUM BRITANNICUM,

An Historical and Botanical account of Fruits, known in Great Britain, by Henry Philips. -Second Edition.

(Continued from page 138.) CACAS.—THEOBROMA;

OR, CHOCOLATE TREE. In Botany, of the Polyadelphia Decandria Class: Natural Order, Columniferæ.

The generic name is derived from two Greek words, signifying the food of the gods.

The cacas, or chocolate-tree, is a native of South America, and is said to have been origiprovinces of New Spain, where besides affordment, it also serves the purpose of money, 150 of the nuts, (which are about the size of Windsor beans,) being considered of the same value as a rial by the Spaniards.

It is not only an article of great internal concommerce of Mexico, to gold and silver. A garden of cacas is said to produce the owner twenty thousand crowns a year.

Chocolate was not known in England until the Pounds per annum, allowing for bad years. eleventh year of the reign of Henry the Eighth, although twenty-three years had elapsed since Columbus had discovered the country of which it exceeds from sixteen to twenty feet in the whole cherries, others very rough like unripe apples. is a native.

all aliments, insomuch that one ounce of it is said to nourish as much as a pound of beef.

An acquaintance, on whose veracity I can rely, informed me, that during the retreat of Napoleon's army from the North, he fortunately had a small quantity of little chocolate cakes in his pocket, which preserved the life of himself and saffron colour; the pade are ovel and point and permitted and saffron colour; the pade are ovel and pointed as distilled a spirit from the nut far exceeding brother officers had perished for want.

covering from sickness.

It is related in Hawkesworth's Voyages, that Commodore Byron, in his passage through the South Seas, found plenty of cacas in the island the pods in heaps to sweat for three or four days ink, and who could not move without assistance. and suffering excruciating pain, were in a few days completely cured by eating these nuts, and able to resume their accustomed duties.

I have often been surprised that the making of the small chocolate cakes for eating, should not have been attempted by some persons in London, when they are in such demand at Paris, where a celebrated manufacturer of these chocolate trifles assured me that he had then, in 1816, received an order from a late high personage in

England that would exceed £500.

ficus covered with oyster shells, in their entire state, with great apparent advantage to the soil.

In the spring of 1814, I made a tour along the banks and sounds of Carolina, from the line of the premiums given at a Massachusetts meeting, some time last autumn, and a few of the results tice of peeling Fruit Trees, was yesterday sent several times witnessed fields that were white are stated below, for the gratification of the cuseveral times witnessed fields that were white with oyster shells, particularly on the main land rious in such matters. fronting Currituck sound, and was told that such fields were much more productive than contiguous ones of similar soil that were without shells. The lands bordering on this sound have a rich soil of loam and sand; and the most remarkable growth that I remember was the chinquopin; but it had also grape vines, dog-wood, pine, &c. The shells were placed there before the memory of the present inhabitants, and by means unknown to them. They were worn smooth and a good deal diminished in size. I was told that in the driest weather the earth immediately under the shells would be usually moist, and to this accumulation or retention of water, as well as to the admixture of the slowly decomposed shell with the earth, was the fertilizing effect ascribed, which had continued for perhaps a century: Forty-three tons nineteen hundred and ten perhaps also something might be ascribed to the pounds weight, were raised, by E. H. Derby, reflection of light and heat from so many white and polished surfaces. I think I have seen two and twenty-seven rods, being at the rate of thiror three fields of fifty acres each and upwards, ty one tons to the acre. that had a shell for every 20 or 30 square inches What I thought very surprising, though the fertilizing effect of the shells was ty of vegetables, (grain, peas, and beans exceptthough the fertilizing effect of the shells was ty of vegetables, (grain, peas, and beans except-of Nature. CALVIN JONES.

Wake Forest, Nov. 25, 1821.

P. S. On reflection, I think I have rated the quantity of shells which appeared upon the Currituck fields too high; but when I saw them nearly eight years ago, my mind was so much occupied with subjects quite foreign to agriculture, that I fear the accuracy of my recollection of the little I observed will not justify a specific correction. I vouch for the general facts.

ON BARKING FRUIT TREES.

SIR,

Comely Garden, near Edinburgh May 23, 1821.

some information from me on that subject, and as I do not wish to conceal any thing that may be useful, I shall endeavour to answer your que-

1st. I published, a few years ago, on this subject, a small pamphlet, entitled "A Treatise on the Physiology and Pathology of Trees." I believe it is not now to be found any where but with myself. I shall send a copy to Sir John Sinclair, to get transmitted to you. 2d. The practice is conducted by taking off all the bark but the inner; that is, leaving it next the alburnum about Six hundred and forty-four bushels were raised the thickness of a shilling: I do it on all kinds of fruit trees in my possession, as pear, apple, cherry and plum. 3d. On the trunks, and large boughs of old trees, it may be done any time in winter, not beginning earlier than the middle of November; young trees, and smaller branches, must not be done till the month of March the soonest. 4th. The effect both formerly and now, has exceeded my most sanguine expectations, in rendering the trees more productive, and improving the quality of the fruit; for I never considered it an experiment, but only following out a law tempting to follow my practice; but this I must in his Treatise on the culture of the apple, has made some very injudicious observations, but has not followed them out. He says, "in very rich soils, such as old fold yard, I have scarcely been able to preserve the native crab from canker."-You will seldom find moss and canker on the same soil; canker proceeds from a rich cultivated soil, moss from a poor, barren, uncultivated soil. If there is any other information, I shall always be ready to give it cheerfully. Perhaps you may hear from me on another subject, when more at leisure.

I am, with respect,

Sir, your's sincerely, P. LYON. To We shall be very glad of this gentleman's future correspondence, and hope to receive his pamphlet as specified. We doubt not but so accurate an observer will attend to such remarks as the subject suggests to our recollection, for the purpose of leading our readers, by his superior coexistent, and we believe always, when the first has existed long. Trees planted where they prepared compost (in both cases supposing the subsoil not to be of a kind calculated to sustain dozen years; during which the produce is some-times numerous, but always imperfect. Second, It is difficult to describe a subsoil in an intelligible manner, which is peculiarly calculated for healthy fruit trees, nor will all trees succeed equally on any: pear trees thrive admirably on a rich masshy soil, incumbent on gravel, with a

ON THE SAME SUBJECT, AND ON THE TURNIP FLY.

Bromyard, May 29, 1821.

I have to thank you for your early notice and insertion of my letter on the subject of "Barking Your opinion on the eventual in-Fruit Trees." jury to the trees by that operation, greatly coincides with my own observations. But as that has, from motives of prudence, been hitherto confined to a very narrow compass, as far as re-

not disappoint this wish.

the important subject of Turnip husbandry, and the means of preventing the ravages of the fly. The experience of an humble individual may not perhaps be unacceptable; and should the hints here thrown out lead only to further experiment they will not be wholly useless. Observation, in many parts of the kingdom, has satisfied me, that if any thing yet known will afford protection and security to the young plant, it is the operation of the ashes arising from burnt weeds, turf, mous letter in The Farmer's Journal of Monday stubble, wood, &c. I say the operation; for it is last, signed by "A Breeder." It is evidently yet unknown by what means these ashes remove written by some person with a view to injure the white of the eye is covered with red vessels, and or keep off the fly, whether by the effluvia ari- stock descended from Lady, and particularly sing from them, or by any other quality disagreeable to the insect. That they have this effect, I am strongly inclined to believe. I have in mous writer has insinuated a falsehood, I think forming the commencement of a speck or film. several instances seen turnips, sown upon land you ought to answer the letter. Lady, the dam which had been pared and burned, strong and of Major, instead of being out of a Galloway vigorous, while those sown within a yard, upon land not so prepared, were wholly destroyed.— out of Old Phanix, the dam of Favourite, the This has happened to myself. In two trials (the sire of Comet. Old Phoenix was also the dam only ones I have yet made, on a small scale, I had plots of ground sown with Swedish turnips, which were absolutely swarming with the fly, burstleft was sold at the Ketter calculation. It arises from colds also, and fevers, short-horned cow that has yet existed. Lady whose attacks threatened in a day or two to anni- herself was sold at the Ketton sale in October hilate the plants : over these I caused the ashes 1810, when fourteen years old, for two hundred of burnt weeds and rubbish, wood, &c. to be guineas; and by a reference to the printed cataafheared clear, that the insect forsook the plants, which grew rapidly, and to a great size. A similar trial this year has, I think, saved a seed bed of Swedish turnips, which were strongly attacked. A friend of mine long converses that the greenders of Lady was held by the public. Two cows, the produce of Lady were sold for 610 guineas, and Major, the son of Lady, was sold for 200 guineas.

It is true, that the greenders of Lady was be adopted in the treatment of Inflammation; for if the disease does not receive a sudden check, the same decided measures cannot be adopted in all the future stages of the disease, sown or scattered. To my own observation it logue of that sale, it may be seen in what estitacked. A friend of mine, long conversant with Turnip husbandry, assures me, that he would almost insure a crop of turnips by depositing in the drills, vegetable or wood ashes, and dropping the seeds immediately upon them. I am far way blood, although remotely; and I have yet inflammation in the horse's eye, are bleeding, from asserting that this mode, or that which I to learn that this blood has been of any injury to purging, blistering, and attention to food and air. have adopted, are infallible: all that I am anx. I am always, Dear Sir, most truly your's. BART. RUDB.

WARDROP, ON THE DISEASES OF THE EYE OF THE HORSE.

The anatomical structure of the eye we may pass over, since the timely application of remedies for occasional hurts, is nowise affected by it. In treating of the diseases, which common attention and little skill may relieve, and which require prompt relief to prevent worse consequences, Mr. Wardrop begins by considering

"Inflammation, as it is the most common so it will insert in your next Journal; it is from a genis the most important disease, in the Eye of the it is the constant effect of injuries. The treatment of inflammation in the horse's eye must therefore be well understood.

"Simple inflammation of the eye is marked by striking symptoms. Though the inflamma-tion be not violent, the animal keeps the eye-lids closed; the eve-lashes adhere together, from the secretion of mucus, which has become inspissated; the eye-lids are more or less swollen, their veins are distended with blood; and there is an unnatural flow of tears, which is more or less copious. When the eye-lids are opened, their internal surface appears redder than natural; the haws are inflamed and swollen; the the corner, or horny coat, loses its clearness and

forming the commencement of a speck or film.
"It is usually accompanied by more or less general fever, marked by heat in the mouth, and thirst, loss of appetite, frequency of the pulse, unhealthy appearance of the coat, coldness of the ears and legs, with alternate heats and chills.

inflammation of all other organs, it most commonly attacks young horses, and those in high condition.

" Treatment .- Much depends on the first means the cure then becomes protracted, and the effects of broke had some Galloway blood in him; and as the disease remain, which blemish, if they do

tion appear immediately to subside by local bleed-ing, yet whenever the system is at all disturbed, blood taken from a large vein, or general blood-letting, is much more powerful in relieving the however, be found, that although the inflamma- tions for hurts, cold, &c. which cause the eye to Turner, of Caistor. From the former of these constitutional derangement, whilst it has an of THE PURIFORM INFLAMMATION equal power in allaying the local inflammation. It will also be found, that if blood be taken from vessels in the immediate vicinity of the inflamed part, the irritation caused by the operation is generally considerable, and though the redness is relieved at the time, it very soon returns by the supply from the collateral vessels, which does not take place after general blood-letting. The orifice made in the vein should be large, and as much depends on the immediate effects of the first bleeding in all cases of inflammation, from three to five quarts may be taken, according to the violence of the symptoms. A second bleeding may be had recourse to, in from twelve to twenty-four hours, should the symptoms increase, or remain undiminished.

" At the same time the horse should be given a purgative ball, or what is perhaps the safer and more efficacious practice, a common purgative ball may be divided into three doses, and one portion given every four or six hours. merely acts gently on the intestines, whilst by making the animal sick, it diminishes the force of the circulation; and it is not attended by the debilitating effects which often follow strong purging. Horses, indeed, whilst they can bear bleed-

ing to a great extent, sink rapidly by purging.
"Nothing is to be done to irritate the inflamed eye; but it is to be frequently fomented with a decoction of poppy-heads, or camomile flowers. A second, or even a third bleeding may be necessary, to remove the inflammation; but these will be in a less quantity than the first, and are not to be had recourse to till a reasonable time has elapsed after the exhibition of the other remedies, so that their effects may be observed. After the acute symptoms have subsided, the eye generally continues more or less weak, and irri-table, and the white of the eye remains red, vinous tincture of opium is also an excellent application, and may be applied by taking a camel'shair pencil dipped in it, and then touching the ball of the eye once or twice a day. Saturnine and vitriolic lotions are recommended, and they may sometimes be advantageously employed, singly, or combined with opium. In some cases too, of old inflammation, where such remedies have failed, a seton put in the cheek has been useful; and in cases of this kind, a course of alterative medicines may also be given.

"It is of great consequence, in the treatment of all diseases of the Eye of the Horse, to pay which owing to my silence hitherto, has been attention to the air of the stable; for as this is attributed to another person. It is true that this often impure, it is proper to keep him in a well-person has made some considerable alteraaired place, and his head placed so that he shall not be annoyed with light, or obliged to stoop for for taking up the sods was a circular punch,

of Tunis-with respect to the introduction of this day of November next, though it is desirable to race of sheep, the following account is given in page 8 of the preface to the 1st vol. of the me-memoirs of the Philadelphia Agricultural Soci-

ety.—Edit. Am. Farmer.
"We owe the introduction of the Barbary mountain sheep, with broad tails, to our gallant countryman, William Eaton, who, when consul at order, Tunis, sent them in an armed vessel in the service of the United States, commanded by Henry Geddes, to Timothy Pickering then secretary of state, who presented a fine ram and ewe* to the president of our society, from whose disinterested zeal, this valuable breed is now spreading through the state of Pennsylvania, and other states in its immediate vicinity. The wool of those sheep, owing to their health and vigour, does not fall off, like the fleeces of those meagre and degenerate runts, which are too frequent here; it is moreover, in general, of a good staple, and next the skin, peculiarly soft and furry. The weight of the sheep is above mediocrity, but their chief excellence arises from their hardihood, and disposition to fatten speedily; a quality they possess in a remarkable degree, which causes them to be highly valued, both by the grazier and butcher. Hatters who are acquainted with it, prefer it, for their manufacture, to any other wool. It spins free, and to any fineness. Glossy, fine and well dressed cloth, has been made of it. Those who have worn fleecy stockings, and gloves, of this wool, speak of it with great approbation. Perhaps a cross with the Merino, would benefit both."

* How many were received, and were any sent into other States ?- EDIT. AM. FAR.

CIRCULAR. July 17.

Sir,-The General Committee of the Board of Agriculture are preparing to publish a second volume of Memoirs. The materials furnished by the County Agricultural Societies are very scanty; and as the General Committee are desirous of promulgating, through this volume, the experimental knowledge of our best farmers, they respectfully and earnestly solicit you to aid them by communicating to the Recording Secretary, any experiments, observations or facts, which have come within your practice, or fallen under ses a threshing machine, price \$20, by which a man and a boy can thresh 50 bushels a day. to extend the sphere of agricultural knowledge. Of the many errors which prevent good fallow ploughed for wheat, thus putting two almost unaided, to weather the winter's storm farming, naked fallowing, many years of ob- fifths in wheat; that for a few years they made and which come to their aid in the spring, just servation have induced me to rank among the prodigious crops of wheat; that at last, they time enough, to keep life and carcase together!

any kind of artificial grass does not pay the ex- ago, and shall now advocate before you, that pense of seed; which by the by, we should not degree of indulgence, which men of experience be under the eternal tax of importing from are the most willing to accord. My system, other states; and that it flourishes badly, or is though essentially variant in one point, was soon eaten out by the blue grass. As it is generally managed, this is very true, for this grass tor, and I felt my confidence in it much increasseems almost the only one in our climate, which ed, when I discovered that it agreed in its imcan bid defiance to every enemy, except the portant features with the very successful prac-plough and the hoe. When we look around and tice of a gentleman who lived on the Western see our fields, after harvest, laid open, in com-mon; the gates off their hinges, the bars of best farmer in Maryland; and further still, so a means for providing the bour fences down, the hogs and all other stock when I recollected how nearly it corresponds arine, which Grisenthwait corpermitted to range at large to graze, to trample with the system of that judicious farmer and tial to the formation of the grain. and to root; shall we wonder then, that the tender worthy man, our present Senator in Congress. clover and other young artificial grasses, are involved in one common and total ruin? The materials cannot be procured to make divisioninvolved in one common and total ruin? The materials cannot be procured to make division-fields which are intended to produce a crop of fences; but when they can, having tried it, I crop and a good price for some of them. With object to it on these grounds:—It will not perenciosed and guarded, during certain seasons mutus to keep a profitable live stock: It processes the felds which are intended motors that felds which are intended motors to the grounds and mutus to keep a profitable live stock: It proof the year, as the fields which are intended motes the growth of noxious weeds, and multi-neighbourhood, and that it should be recurred to to produce grain. It were just as preposterous plies and protects destructive insects. The again; not as a chief crop, but as an auxiliary, crop after it, does not grain so well, nor does without guarding it in its incipient growth, as it improve the soil in the degree that some supits an exhausting crop; but because it is an exhausting crop; but because it neither afaimilar neglect.

zing, cannot be profitably united; and strange as it may seem, this assertion has actually grown as it may seem, this assertion has actuarly grown to farm bactuarly grown to farm be a maxim here, whilst the best farmers in perhaps he might farm advantageously with any ployment for many rainy days; which would Europe. Pennsylvania. Virginia, and this State, system; yet he will farm better if he interpo-otherwise be lost. The eloquent objections, have for the last quarter of a century at least, been practically demonstrating to the world, that it is untrue. My experience is, that we had better give our grasses and hay to our livestock, than to give it under a lay to the wheat of land requiring rest, as if like an animal, it pletely removed, I conceive, by the introduction crop alone. These green dressings of vegetable matter are but transitory and superficial derful that they entertain such a notion, when possessed of the modes of carting and applygildings, utterly deceptious is their promise of it is known that they always dress their land ing manure, of which our planters at the time hermanent improvement; but when converted with manure of the strongest kind, and which no he wrote, were utterly ignorant. Tobacco like into animal manure it enters more fixedly into country will afford in sufficient quantity, but one the composition of soils. When therefore our so thickly settled as China. herbage is given to live stock, instead of to the wheat, the immediate profit of the crop is perhaps as great, and that which the land retains, is over and above. One of the most learned and intelligent of modern European writers, Grisenthwaite, has lately ascertained that soils to produce good grained wheat, must contain a certain portion of animal matter: to afford which, live-stock are necessary.

Perhaps the author who combines more effectually the general opinion of the English farmers, is Sinclair; and to prove to you that it is his opinion, that grain farming and grazing, are the fi most profitable when united. I beg to refer you lows: to his Code of Agriculture.* We are also in-formed by Radcliff, who has written an account of the agriculture of the Flemings, a people reputed the best farmers in Europe, that they have a maxim in Flanders—"No grass and hay, no cattle; without cattle, no manure; and without manure, no crop." A rigid adherence the last winter it is in grass. to this maxim I take it, is the solid foundation on which is erected that superiority in good management, for which they are so justly famed.

I come now to offer some remarks on the best system of farming. It has not fallen to my lot to meet with, or read of any man, who has settled down fixedly into a rational, digested system of farming before he has had ten or fifteen years of experience. This proves the difficulty of our art, and will ensure for my errors in the

We frequently hear it said, that the crop of one which I digested for myself some years

ses meliorating crops of grass between exhaust-ing crops, and still better, if he allow the land to rest under the meliorating crops.

Young, and Davy both assent, that the light, thin soils of England require rest under grass, to renovate them; and if so, in how much grea-ter degree must it be requisite here, where our the world will justify this assertion. In the sun is so scorching, our fields so large, our popu-bread stuff culture we have competitors for sources for manure comparatively so scanty.

permit, into four lots, proportioned to the size of ton-articles of greater profit.
the field as one is to ten, and cultivated as folthe field as one is to ten, and cultivated as fol-

1. Year in corn manured in the hill, or broadcast.

2. In wheat.

If a salt meadow, or other back pasture can be added, to contain all the stock, fed occasi-ginta to possess, over any other section of our onally on hay from the time they are turned off widely extended country.

the field intended for corn, until the clover is grazable to advantage, which is not till about the first week in June, it will be found a very now, when the low price of most things renvaluable acquisition.

The lots tilled in nearly the same rotation.

1. Year in tobacco, and other small crops of pumkins, &c. manured.

2. In wheat.

3. In clover to be cut.

4. In clover cut, or grazed, and treated as the field.

If we cannot divide our lots by fences, which are so desirable when we raise or fatten stock, the same small crops may, with almost equal advantage, be tilled within the corn field.

Putting all the stock during the winter and spring, on the field intended for corn, adds to its fertility, and together with ploughing late and corn, I have found the best security against the clover insect, the ant and the grub-worm. It is also a means for providing the best ingredient, urine, which Grisenthwait considers essen-

There are many advantages resulting from the tillage of a variety of crops, and not the least It may be said with propriety that Manure is fords food for man nor beast; and because the More than one writer on agriculture has laid the basis of all good farming, and he who has offal, though of prime quality as a manure, is down the position, that grain farming and grada particular system or routine of crops, if he mavery inconsiderable in quantity. Tilled in a small nures one of them in each course, cannot be said way, it cannot seriously interfere with manur-to farm badly. Indeed, with a plenty of manure, ing or other work, and it serves to afford emfound in a chapter on the subject in his notes on Virginia, raised by the illustrious Jefferson, and who I believe almost wrote the crop down, We are told "the Chinese smile at the idea are as to a partial tillage of this crop, comevery thing else has has fallen in price! but this fall is only in proportion to the rise of money value. It can never in periods, of profound peace be so heavily depressed as bread sun is so scorching, our fields so large, our population so thin, our labour so scarce, and our reor less degree, in almost every hole and corner The system which I have for six years been of the civilized world. Not so with tobacco. Its practising with increased confidence at every district is narrowed down to a "very slender tillage, and which I would recommend, consists belt." On the one side, climate forbids its tillage; in a division of four fields; and, if enclosures on the other it is supplanted by sugar and cot-

Europe and Asia, from a variety of causes must continue to decline the competition.

Independent of the noble bay and rivers that flow within their limits, and the facility with 3. In clover, cut or carefully grazed. which their waters may be connected with those of the Western country, facts that may and then made common for all the stock during be regarded more as commercial than as agricultural facilities, there are decided agricultural advantages, which I believe this state and Vir-

> ders it so important to get them to market at a very trifling cost. With our facilities of getting to market, we only require industry and good system to enable these states to compete, successfully, with the most fertile regions of the Western country.

But in Virginia, they can cultivate cotton to advantage, and in both states we can grow in the greatest perfection three important staples, wheat, corn, and tobacco; from which we may

grain is inferior to northern corn. to strengthen our confidence under providence, in our own exertions for the attainment of agricultural prosperity, and consequent domestic

happiness.

York, nor of the Connecticut river; yet it is bid defiance to our skill, all bountiful provibelieved, that wasted as it has been for centudence seems to have placed as a dernier resort ries, still there is not a district in any of the atlantic states of equal extent, which can produce so much crop, with the same labour and stands almost unrivalled.

GARDENING, &c.

Huntsville, (Alabama,) July 12, 1822.

JOHN S. SKINNER, Esq.

Sir:—I observe in your last No. (11,) informative so much crop, with the same labour and stands almost unrivalled. duce so much crop, with the same labour and stands almost unrivalled. capital employed as does this peninsula. Look Our lands though low the small pittance of one shovel full of manure lity with which our lands are tilled ;-no hills, no rocks, no ravines to intercept the continued the facility with which the poor may draw necessaries and the rich obtain luxuries from the water, by devoting a few hours in each week to that object or giving the equivalent, and say whether it is not preposterous in any man, be he rich, or be he poor, to go elsewhere in quest of "brighter skies, or fatter lands?" Nay, more, -say, whether it is not owing to the bounties of providence too profusely showered, that the people on the waters of the Chesapeake are so proverbial for their bad husbandry and negligent management? It is a trite but true remark, that will always make the greatest exertion, where the difficulty of procuring subsistence most requires it." And, besides affording us many articles of wholesome and delicious food, and many sources of manure, our waters are our public highways; and the winds of heaven are our carriers to market. The bounty of nature has relieved us from the expense of turnpike roads, and removed from us half the necessity for carts, for horses and for oxen.

With regard to health, our climate is perhaps in no respect inferior to that of our neigh-

make a choice; or, we may embrace them all. bours. Our shore has been remarkably exempt aspect of his plantation? Such considerations Dr. Morse informs us in his geography, that in from autumnal fevers, for twelve or fifteen years cannot be in better hands than your's, and wishthis State "two articles are peculiar; the genuine white wheat, which grows on this shore, have by no means been solitary in our affliction. Believe me, and degenerates in other places; and the bright Fogs are supposed to be indicative of an unhealkite-foot tobacco which is produced on the thy climate, and the fact may be considered Western shore."* This wheat, which grows in not a little curious, when I assert that we have the greatest perfection within twenty miles be- not, on this part of the shore, one fog for every low Wye river and the same distance above, ten which they have in the highlands about is believed to be equal in quality to any produced in the known world; and the kite-foot to- here as they are, every where, to the North. bacco is exceeded by none perhaps in value, ex- The cause of this fact, is not difficult to assign. cept the crop of Cuba—the Varinas.

On the contrary, in the adjoining fens, where the land is very good, but PEELING AND BARKING FRUIT-TREES, lies on clay, the apple-trees canker; and on skir The inquiry introduced through the treatise of ty fen land, where the bottom is rapidly dried Mr. Lyon, is to us, extremely interesting; and in spring, and much indurated in summer, (alas we expect to hear from that gentleman on the though the surface soil is deep) the disease is

rea ma fer

" We are told (says Mr. Lyon) that trees canker because their roots run into a cold till, or barren subsoil; and yet we are informed that in rich soils (as old fold-yards, &c,) they can scarcely preserve the native crab from canker," p. 72. But he does not consider, that a very rich surface soil, artificially made, may lie upon a barren subsoil (hollow or indurated) which is quite unfit to sustain a healthy tree of some years standing. And this is precisely the situation most liable to the disease; that is where young trees grow vigorously, but when their roots plunge, and seek nourishment from the bottom, they suddenly canker and decay. At the first, the trees make abundance of top, but they cannot stand with large tops, unless the roots descend in proportion; in plunging they get into a soil by no means equal to the surface, and thus the balance is lost between the top and bottom. Their vigorous shoots are then the power of the atmosphere, and the trees canker, not because they have too much nourishment from below, but because they have too

We find have the far fore-foot and near hindfoot white, especially if he have a star with it."

We find have the far fore-foot and near hindfoot white, especially if he have a star with it."

Description little.

mer, must necessarily be saturated with the winter's wet; the surface soil may, notwithstanding, be mellow with gardening, and rich with manure; and the trees in spring put out abundant leaves, and prepare for vigorous growth; but in a very short time there is a deficiency of moisture below; the subsoil will not hold it; men's fancies, there being good and bad of all the right or left.

"Ermined white feet (says our author) are those should so make use of them from one generation to another, they would at last become like to the natural race of the country wherein they are: therefore I would never advise you to choose a stallion from your own breed, but rather that you would change him for a good barb or Spanish horse; but still make choice of the most beautiful mares of your own race to breed by nature, and liable to part by fissures in sum-ther the fore-foot be right or left. the water suddenly sinks, and percolates away, colours, as well as of all marks.

"A feather is nothing else but a turning of the hair (sometimes called a rose) resembling in some an ear of barley, and a kind of oilet hole in others. Thus, if it stay, much longer than the rest. or moderate the ascent of the sap in the spring, the tree may be better enabled to sustain the ashes, and being almost thoroughly roasted, preparation it makes for leaves and fruit: by they divide it in two, and dip it in scalding Mr. Lyon's own reasoning, it admits the effects hot walnut eil, after which they immediately apof light and heat on the trunk and branches, ply the flat side of it to the part of the forehead which assists the concoction of the increment as where they intend to make the star, and keep before. The fact is certain, that of cankered it there for half an hour; then anoint the scalded trees of some year's standing, it occasions much place with oil of roses: in a short time the more and better fruit, but the modus operandi, may, without any great reproach to our understanding, be left among the arcana of nature.

Excepting that as we differ in this way from the reasoning of Mr. Lyon, we agree with him in many important particulars, which we shall re-fer to with pleasure in our future Numbers.— Editor Farmers' Journal.

thers.

"Although these marks, in the opinion of the Duke of Newcastle, are nothing but so many absurdities; as also what people say of white-footed horses, that there are four good marks belonging to them, and seven bad; yet since many people rely much upon them, I shall describe them as briefly as I can.

"The first good mark is when a horse hath only his far fore-foot white; the second, when he hath his near hind-foot white; third, the two hind feet white is a good mark, especially f he has a star, or a blaze in the forehead. Four white feet shews good nature, but are is quoted from the Duke's book, which the above

will incline to be brittle.

"The far hind foot white, is esteemed a bad mark; also the two fore-feet, but is not very common. The two fore-feet, and one hind-foot, is somewhat better. Two white feet of a side good, and of a good breed, will bring you forth good, and mark, so it is when a horse is cross more beautiful foals than any other, in respect

they were burnt. So sudden an alteration of abundance and want are incompatible with regular health and progressive growth. We shall here add one practical fact, which goes directly to support this reasoning,—namely, that to rate from each other, or so joined as to form a OF THE SPECIFIC INFLAMMATION OF prevent the canker, in a great measure, on such kind of feather. Or if the like mark be upon soils, the only method is to trench up the soil the ply of a horse's thigh, and upon the back and subsoil, two or three feet deep, and let all part of it, near to where the end of his dock

"It is said of horses which have white faces.

will rectify that blemish.

"Every horse that is not white or gray, is

"The Hollanders roast a large onion in hot scarf skin falls away, and there grows up in the new one some white hairs; but the star in the middle remains always without hair, as was before observed."

" A discourse of Breeding, and how to raise a good and beautiful race of Horses."

(that is, when the trees grow in the best subsoil) From Sir Wm. Hope's "Complete Horseman, ful, remarks, on breeding in general; or at least the canker does not take place. Stars, Blazes, and Feasomething which might be applied to the question which has lately been agitated in the Journal; and also to that which has been since proposed. (The subject is important, and is one of perpetual interest in agricultural pursuits.) But we experienced an almost total disappointment; which serves to shew that little or nothing had been then considered, or decided, in regard to domestic animals in general; nay, even as regards the subject above, scarcely any thing important is to be found, but that the Duke of Newcastle never used the colts of his own breeding for stallions; but chose the most beautiful of his mares, and put them always to imported horses from the original race. The passage author says was very scarce and dear when he was writing, above 100 years ago, and there-

fore he only gave an abstract of it.
"You may provide yourself of young breeding Thus a hollow and sterile subsoil, indurated a nature, and liable to part by fissures in sum-ther the fore-foot be wight called.

THE EYE.

The disease now to be described, is perhaps the most common, and certainly is by far the most dangerous disease of the Eye of the Horse. known.

This inflammation is seated in the internal

eye, commonly marked by the eye-lid being shut, a copious secretion of tears, the white of the eye appearing slightly red, and the whole anterior chamber of the eye dim and coloured; there being no distinct speck on the cornea, as takes place in the common inflammation of the eye. The redness of the eye-ball is never very remarkable, even though the disease assumes its most aggravated form; but the dimness of the anterior chamber increases rapidly, and in two or three days, or even a shorter period, a yellow spot appears at the bottom of that cavity, arising from the formation of pus. Sometimes the quantity of pus is very considerable, and I have seen it fill at least two-thirds of the anterior chamber.

After lasting one, two, or three weeks, the We entered upon this chapter with great inflammation and watering usually begin graduhopes of finding some curious, and perhaps use-ally to subside. The pus, though in a very large

quantity, is sometimes almost entirely absorbed, of that expedition. A gentleman from this the hay, will be found also to conduce much to

attack of this kind.

succeed each other at very different, and sometimes at very distant intervals, until the whole ing the largest and fairest ears for seed, until it pupil is filled with an opaque white matter, and grew nearly as large and as fair as the common the sight of the eve completely destroyed.

During this progress, the disease is often confined to one eye, at least one eye is usually much cluded it would, in process of cultivation, be-more severely affected than the other. In some come assimilated to the common corn of New cases the two eyes are simultaneously affected, England-although I accidentally discovered that

horse becomes completely blind.

If an eye, which has in this manner suffered, the horse, " Moon blindness."

tion; though, as far as I have been able to obbred, and in high condition. probable, that dark, hot, and ill-ventilated sta-bles, must have great influence in the production of this disease.

It is supposed to be most frequent in particular lines of blood; and those who breed horses for the turf, are averse to breed from mares or stal-

lions who have weak or blind eyes.

This disease has usually been found incurable, and when a horse's-eye has once been affected with it, the proprietor is generally anxious to sell the horse, aware of the disease returning sooner or later, and finally terminating in blind-

Bleeding, moderate purging, a cooling diet, and a well-aired stable, afford a temporary relief, and moderate the severity of the symptoms. Considerable benefit is derived, in some cases, from the application of the vinous tincture of opium two or three times a day, in the manner formerly directed. A seton in the temple, or cheek, has also been advised by some; but as far as I have been able to observe, these remedies never prevent the repetition of attacks, and the ultimate destruction of the organ.

FROM THE OLD COLONY MEMORIAL.

Sir,-In your last paper, a correspondent in-" from whence came the sweet corn, and

at what time it was introduced here?"

Of the natural history of the sweet corn, it is presumed, that with all the other species of Inparticular species, nothing was known in this section of the country (if in New-England) before 1779, in that year an expedition under the command of General Sullivan, was sent against the Six | There called Pappoon corn-probably from nations of Indians, inhabiting on the borders of its tenderness and sweetness, made the food of chilthe Susquehannah. Peer's brigade made a part dren.

so that scarcely any vestige is to be seen; and place, then an officer in that brigade, on his re-the health and thrift of the stock. For the use in other instances, thin webs of opaque matter turn, after the expedition, brought some ears of of salt in the winter is accompanied sometimes remain, which destroy the transparency and lus- that corn. That was the first of the species with costiveness, and and at others it produces tre of the eye, and which by their adhesion to ever seen here, and has, since that time been opposite effects, and invariably renders the cattle the edges of the pupil, interfere with its mo-more and more diffused; and I believe within a more susceptible of the cold. And it not unfrefew years only, has been generally and extensive-quently results in the loss of flesh, and disease.

It is astonishing how acute dealers in horses by cultivated for culinary purposes. The speToo profuse an use of salt upon hay would no are, in discovering an eye which has had an cies has undergone some change since it was first doubt prove detrimental. About six quarts to stack of this kind.

Sooner or later, whilst the horse appears in and after being boiled, and the corn taken off, if series of years, pursued the practice of salting a state of perfect health, the eye is again at-the core was laid in contact with any linen (the my hay in the mow, I consider it superior to any tacked, the disease being accompanied by the table cloth or a napkin,) it communicated an in-other method of using salt, by at least, two hunsame symptoms, making a similar progress, and delible stain, this inconvenience has disappeared dred per cent.

—this species also, like what is distinguished by having the same termination; whilst each new —this species also, like what is distinguished by attack is accompanied with the deposition of the appellation of southern, or flat corn, by remore and more opaque matter. Those attacks peated planting here, assimilates to our local corn -for a number of years I was careful in selectcorn, and at the same time lost much of its peculiar qualities, softness and sweetness; and I conand finally, by a succession of attacks, the the ears which were produced on the suckers (and it is very much disposed to sucker) were smaller, much more disshevelled, and in appearbe dissected, it will be found that the external ance perfectly similar to the corn which I first changes have been accompanied with still more remembered to have seen. I then selected some serious internal derangements. The crystalline of the ears from the suckers, which were suffilens has lost its natural transparency, forming in ciently ripe and severed for seed, and found, that the human eye what is called a Cataract, or in on the next year's planting, I had reproduced corn, at the least ten years retrograde; and It has already been noticed, that horses are have since then, annually saved a portion of the very subject to this disease. It attacks them of seed in that mode, the fact will be obvious to any all ages, of all classes, and in all states of condi-one who is in the practice of gathering the corn, that the ears which are produced on the suckers, serve, it is most common in those that are high though small, retain the milk longer, and are It is therefore suitable for the table longer, than those that are produced on the leading stalks. Yours, &c

PLYMOTHEUS.

THE FARMER.

Hay.-The best period for cutting clover and herds-grass, is when they are in full bloom. This will be found to improve the quality of the hay more than is ordinarily supposed. Other grass, that grows short and dense at the bottom especially on cold and moist lands, and also on lands you do not intend to plough, should not be cut so early .- Not only will the crop of hay be materially lessened, but the land will receive no inconsiderable detriment from such early mow-

The practice of salting Cattle in the winter is extremely injurious and should be abandoned.-To prevent the necessity of this, by far the best method is to put the salt upon the hay when it is put into mow. If this is done, your cattle will require no salt in its crude state during the whole winter nor will they take it if offered to them,-Another inducement to the practice of salting hay in the mow, is the unavoidable waste of salt and labor which accompanies the old method of using it in the winter in its crude state. It also prevents the danger of the hay's suffering injury presumed, that with all the other species of In-dian corn, it is indigenous to America. Of this casion much less waste in the expenditure of it

Captain Richard Bagnal, then a Lieutenant.

As tea contains volatile parts that should be preserved, and in which its better qualities exist, the tea-pot should be handed to each person on a tray with cups and sugar; for when made out of the room, all its reviving spirit has evaporated before it reaches the guest. It is not the bitterness but the fragrance of tea that is cheering. When the infusion has once been completed, it is found that any further addition of the herb only affords a very small increase of strength, the water having cooled, much below the boiling point, and consequently acting very slightly; therefore it is better to make fresh tea in a second vessel, than to add it to the exhausted and cool leaves. -Phillips's History of Cultivated Vegetables.

The brated antidote, called Mithridate, a particular translation of the account of which will be found to be compared to the succession of the walnut. cy as his own, found time to write a treatise on

It was in the 68th year before the birth of Christ, that Lucullus planted the cherry-tree in Italy, which "was so well stocked," says Pliny, "that in less than twenty-six years after, other lands had cherries, even as far as Britain beyond the Ocean." This would make their introduction the manor and mansion belonging to his queen, to England as early as the 42d year before Christ, although they are generally stated not to have been brought to this country until the early part

Some idea may be formed of the Roman gardens, by the luxurious manner in which Lucullus the vicinity of London, have what is termed an lived in his retirement from Rome and the public upper and under crop, which is done by planting affairs. He had passages dug under the hills, on strawberries or currants, &c. between the trees;

succession is so skilfully intermixed, that the cherries as being cultivated in Italy when he fertility of the soil is by no means exhausted, wrote his Natural History, which was about the 70th year, A. D. " The reddest cherries," con-Lombardy which extends along the right bank they must be eaten when gathered, as they will of the Po, that is to say, a part of the first agnot endure carriage." The Duracine cherries were esteemed the best, but in Picardy the Porabove. The reader will perceive that the crops tugal cherries were most admired. The Macethat was grafted, in his time, on a bay-tree stock, which circumstance gave it the name of laurea: this cherry is described as having an agreeable bitterness. "The cherry-tree could never be made to grow in Egypt," continues Pliny, " with all the care and attention of man."

The county of Kent has long been celebrated for the quantity of cherries which it produces, and in all probability, they were first planted in this part of England, of which Casar speaks more favourably than of any other part which he visited. Some authors assure us, that the whole race of cherries that had been brought to this country distinct Genus; but Linn cus pronounces it of by the Romans, were lost in the Saxon period, and were only restored by Richard Harris, fruiterer to Henry the VIIIth, who brought them into Europe by the overthrow of Mithridates, king from Flanders, and planted them at Sittingbourn

thirty-two acres in Kent, which, in the year 1540, produced fruit that sold in these early days for £1000, which seems an enormous sum, as at that period good land is stated to have let at one shilling per acre. We can only reconcile our minds to this great price, from the deficiency of other fruits in this country, and the splendour in which Henry the VIIIth and his ministers lived.

Fruit orchards are still considered the most valuable estates in Kent; and I learn from Boys's Kent, that cherry-gardens, while in full bearing, pay better than orchards; but the cherry-tree does not generally continue more than thirty years in perfection. Mr. Randall says he has known a single cherry-tree produce fruit that he has sold for above five pounds per year, for seven years in succession. Gerard says, "the Luke Warde's cherrie is so called, because he was the first that brought the same out of Italy; another we have called the Naples' cherrie, because it was first brought into these parts from Naples : the fruit is verie great, sharpe pointed, somewhat like a man's heart in shape, of pleasant taste, and of a deepe blackish colour when it is ripe."-This author mentions the Spanish and the Gascoigne cherry, &c. and says, "there are many other sorts in our London gardens."

COCOA-NUT.-COCOS.

Natural Order, Palmæ; in Botany, a Genus of the Monacia Hexandria Class.

The cocoa-nut appears to have been known to the ancient Greeks, as I find the Macedonian soldiers, who accompanied Alexander the Great the nuts, and which is caught in jars attached to esteemed in his expedition into India, met with various Indian fruits, although they were not able to give the names of them. This nut was evidently one of the fruits they discovered; and their account of it has been faithfully transmitted to us in the twelfth book of Pliny's Natural History, chap. 6. "The fruit," he says, "is put forth at the bark, having within it a wonderful pleasant juice, and is a gentle purgative, without being nauseous or in such abundance, that one of them is sufficient producing colic; it is also recommended in to afford a competent refection for four men."-The Macedonians described the leaves as being

of great size, resembling birds' wings.

From this period, which was about 325 years before Christ, little or nothing more was known of the cocoa-nut by the Europeans, for the space poisons. ralists as well as the trader, this fruit became once more known to the Old World; but it is only of late years that the cocoa-nut has been a superior to the greatest importance in dyeing silks, cotton, or woollen stuffs, as it prevents black and other caustic colours from burning them, and gives a brilliancy to the colour. The brought to England as an article of commerce .-It is now used by the West-India captains instead of wedges of timber, to fill up the vacua be-tween the casks and other packages in their ships. The freightage of these large nuts is consequently considered as of no charge: they are therefore now become as common in the flax, is then manufactured into linen. shops and in the streets of London, as the orange.

The cocoa-nut is the produce of a tree of the first importance to the Indians, as it furnishes them with meat, drink, physic, clothing, lodging,

furniture, and fuel.

Chambers states, that many travellers aver, from the size and useful product of this tree, that from a single cocoa-nut tree and its fruit, a ship might be built, equipped, and laden with mer-

chandise and provision.

It is supposed to be a native of the Maldive, and some desert islands in the East Indies, and from thence to have been transported to all warmer parts of America. The largest cocoa-nuttrees grow on the river Oronooko, which reach to the height of sixty feet, and, bearing all their foliage at the top, produce a beautiful, waving, easily penetrated than the rest: from this, when from Constantinople in 1615, informing his friend, featherlike appearance.

COFFEE.—COFFEA.

In Botany of the Class Pentandia Monogynia; Natural Order, Stellatæ. It is named after Caffa, in Africa, where it grows abundantly.

This berry, which affords such a wholesome and agreeable beverage, is said to have been drunk from time immemorial in Ethiopia, but of this we have no authority; and as the use of most plants has been accidentally discovered, it is probable that the properties of coffee might have been first perceived by a goatherd (as related by Chambers,) who observed that his cuttle, after browsing on this tree, would wake and caper all night, and that a prior of a monastery, being in-formed of it, first tried it on his monks, to pre-

vent their sleeping at matins.

About the fifteenth century the use of coffee appears to have been introduced from Persia by Gemaleddin, Mufti of Aden, a city near the mouth of the Red Sea. He, finding it dissipate the fumes which oppress the head, give cheerfulness, and prevent sleep, without injury, recommended it to his dervises, with whom he used to spend the night in prayer. It was soon after this drunk at Aden, by all studious persons and those who travelled by night. It was progressively used at Mecca, Medina, &c. and Grand Cairo: length, are made into baskets, hammocks, mats, brooms, racks, &c. and are used for the thatching of houses; the trunk of the tree is employed for gutters, and split into laths for covering buildings, &c.

The shell of the fruit, when polished, is formame of Shems and Hekin, in the year 1554, each of whom opened a public coffee-house in that city. These coffee-houses becoming a rentance of the company of the dezvous for newsmongers, who made too free with state affairs, were suppressed by Cuproli, the Grand Vizier.

Rauwolfus, who was in the Levant in 1573, was the first European author who made any mention

of coffee.

The cocoa-nuts have three holes closely stop-ped; one of these being both wider, and more coffee. Pietro Della Valle, a Venetian, writes atherlike appearance.

the nut is planted, rises the germen, or young that upon his return he should bring him some tree, first having ramified, and filled the whole coffee, which he believed was a thing unknown Lord Chancellor Bacon makes mention of it in sented Louis the Fourteenth with a coffee-tree, and is recommended to those of constitutional

having been with M. de la Haye, the French ambassador at Constantinople, did, when he return ed to Marseilles, in 1644, drink coffee every it was M. Thevenot, who taught the French in 1657. It was made fashionable and more known in Paris, in 1669, by Soliman Aga, ambassador from Sultan Mahomet the Fourth, who gave coffee at all his parties with great into France, the ambassador's splendid porceshow.

Two years after, it was sold in public at the Foire St. Germaine, by Pascal, an Armenian, 29,528,273 lbs.; the next year they were lessenmake it an invaluable article with the Turks. who afterwards set up a coffee-house on the Quai ed about four millions of pounds; in 1812, the de l'Ecole; but not being encouraged in Paris he left that city and came to London: however, Every gentleman who he soon after this, some spacious rooms were opened in Paris, for the sale of coffee, and they soon increased to upwards of three hundred.

It is said to have been first brought to England by Mr. Nathaniel Conopius, a Cretan, who made it his common beverage, at Baliol College, at Oxford, in the year 1641, and that the first cof-Jew, at the sign of the Angel in Oxford, in 1650. has the resemblance of a shower of snow, which ble principles. An interesting analysis of coffee was made by M. Cadet, apothecary in ordinary to the houseand being of a fine dark green, make a beautiful hold of Napoleon, when emperor; from which contrast with the clusters of pure white blossoms, it appears, that the berries contain mucilage in abundance, much gallic acid, a resin, a concrete mine. Nothing can be conceived more delight- essential oil, some albumen, and a volatile aro-ful and grateful than the appearance and perfume matic principle, with a portion of lime, potash, fee-house in England was kept by one Jacob, a of a field of coffee-trees when in full bloom : it charcoal, iron, &c. Roasting develops the solu-

Dr. Moseley, in his learned and ingenious Treatise, states, that "the chemical analysis of coffee evinces that it possesses a great portion of mildly bitter, and lightly astringent gummous and resinous extract, a considerable quantity of oil, a fixed salt, and a volatile salt. These are it's medicinal constituent principles. The intention of torrefaction is not only to make it deliverthose principles, and make them soluble in water, but to give it a property it does not posses in the natural state of the berry. By the acshutup coffee-houses as seminaries of sedition : the celebrated gardener, is of opinion, that the tion of fire, it's leguminous taste, and the aqueous part of it's mucilage, are destroyed; it's saline properties are created, and disengaged, and it's oil is rendered empyreumatical. From thence arises the pungent smell, and exhilarating flavour not found in it's natural state.

" The roasting of the berry to a proper degree, requires great nicety. If it be underdone, it's virtues will not be imparted, and in use it will load and oppress the stomach: if it be overdone, it will yield a flat, burnt, and bitter taste; it's virtues will be destroyed, and in use it will heat the body, and act as an astringent. The closer it is confined, at the time of the roasting, and till used, the better will it's volatile pungency, fla-

vour, and virtues, be preserved.

"The influence which coffee, judiciously pre-pared, imparts to the stomach, from it's invigorating qualities, is strongly exemplified by the immediate effect produced on taking it when the stomach is overloaded with food, or nauseated with surfeit, or debilitated by intemperance, or

W. M. DINSDALE.

Little Marshall, Ide, near Exeter.

Sir, Devon, May 24, 1821. A letter in your Journal of Monday last, rethis individual case, others are not wanting, A letter in your Journal of Monday last, re-whose facts lead to the same conclusion, and I news in my mind a subject I have often been on shall mention one of them. It is generally be-lieved, and will not I think be denied, that the relates to horses of quick action, of as much most celebrated breeder of improved Hereford importance as Wardrop's Essay on the Diseases cattle, grafted his stock upon animals in no way of the Eye: I mean the consideration of the partaking of Hereford blood; and to his judicious selections on those occasions (veiled under application of an inelastic ring as a protection to the closest secrecy,) has been attributed the a part, formed, in all its outward parts, by Nacopious bleeding from the jugular vein. denomination of improved Hereford cattle. Twenty years ago, or rather more, in the indulthe contrary.

I have trespassed so far on your valuable pation taking place in the foot: in some, the afmind had become alive to the subject, I became acquainted with Bracy Clark, an eminent London Veterinary Surgeon, who was posecuting a similar inquiry, and through his professional information I was ultimately indebted to the knowledge of what was requisite to the heathy protection of the foot of that truly noble animal, Allow me to recommend the following method the horse. This induced me, six years ago, for the accommodation of gentlemen whose horses after simmering the neats' oil and wax a little in or contraction, easily accommodated to the foot by "frequent mental contributions," as thee deapipkin, the oil of tarmust be added, when, after a lof any horse. After I had used this shoe twelve sires me to do. But I feel great delicacy in vena pipkin, the oil of tar must be added, when, after a of any horse. After I had used this shoe twelve gentle simmering again for a few minutes, stir- months, I wrote Bracy Clark an account of the turing any remarks among the able productions of will be finished; at the same time, if an ounce most sanguine expectations; still they were not theory of Agriculture, that my observations must of naptha be comeatable, and the purpose for altogether fit for general use, and therefore no necessarily be confined to a few practical matpublic exhibition took place of them. I howe- ters, such as might occur to any one who has pense no object, the composition will, by the ad-ver, continued their use, and with great success, been raised as a plain farmer.

P.S. As none of your correspondents who have with hot water first is advisable, and the liquidiam happy to find, has now brought a shoe to should be driven in before the fire.

Leather or cordage dressed with this liquid neperience. It is now six years since I have used
ver rots, hardens, grows mouldy, or perishes with jointed shoes, and I therefore think I may be althe form, about seven years back, to a person particularly for that part of the agricultural world who are engaged in breeding and breaking valuterwards, contrary to a pledge given me, sold able horses, many of whom are sent, at early the same to two people who now retail a very ages, to London, with contracted feet from shoeing, not as the general mode of expression is, "bad shoeing," but from shoeing which, as generally used, is altogether, in the BEST HANDS,

> I send you herewith (which I shall be glad, when your curiosity and that of your friends in them up by astringent applications, or filling common mode, and the other to one that had never worn other than the jointed shoes, and ly inflammable, and therefore should be kept age of the horse is from 25 to 30 years! How arising from the mode of shoeing in general practice!

The horse arrives at his full growth at seven, and full beauty and roundness of parts at nine, after which they are capable of their greatest exertion; yet, from the uncorrected evil in the old mode of shoeing, few persons like to buy a horse without a mark of CHILDHOOD in his mouth.

I remain, Sir, Your's very obediently JOHN HALL.

P. S. I last week had a young Guernsey bull

The difference in appearance, both in shape and colour, and in density (or ossification,) between the two coffin bones sent, is very striking; that from the foot shod on the improved principle, is whiter, better formed, more porous, and specifically lighter than the other; which latter is too perpendicular (or stunted at the toe,) somewhat twisted, narrow, and rough like a rasp, the difference in colour may be owing to the latter having been longer kept, or taken from a more aged animal; but if the other peculiarities be owing to the shoeing, as above stated, the subject is deserving the most serious consideration of every man who is interested in horses.-EDIT.

FOR THE AMERICAN FARMER.

A "PLOUGH-CLEANER;" AND A "HOLD-FAST."

Downingtown, (Pa.) 7th Month 14th, 1822. RESPECTED FRIEND,

I have received thy acceptable letter, and really wish that I could add to the merits of thy work, thy correspondents. And I know so little of the

the Philadelphia Agricultural Society, and it was approved by their Committee on Implements.

The staff B, rests towards one end on the coupling round of the plough handles; at the other end it has a mortice, A; to receive the upright E; they are connected by a pin, so as to work like a hinge.

The upright E, is placed three inches before the coulter D, and joined to the beam, C, by a were now dry which were never before exhaustscrew bolt, which may be passed through either of the three holes in the upright, so that its Stage Tavern of that City, and Chambersburgh, range can be adapted to the depth of ploughing.

The front edge of E, is made a little circular, to prevent its acting as shears; G, represents a lecting and distributing agricultural intelli-circular thin steel spring, screwed on the beam gence in the form of reports from different and tied with a string to the staff, B. The whole parts of the country, as proposed above, would be plough.

backwards causes the lower part of E, to advance to be used again.

I will now likewise give thee a description of a very simple means, called a "hold-fast," by the use of which, sheep, calves and hogs, may be carried in wagons or carts, with perfect safety; and, which may be very useful at sheep-shearings.

The stick A, should be about three feet long with a mortice near to each end, BB, to receive doubled straps, CC, the loops of which will fasten one fore and one hind leg against the stick, whilst the others are tied on the opposite side by the ends of the straps.

When such animals have their legs all drawn together, as we usually tie them, the stomach and bowels are so compressed and injured by their confined struggles, as often to occasion injury and loss; but the "hold-fast," allows their limbs to be extended, and keeps their fore legs distant from the hind—thus, they may be carted than 80 cents per bushel!!! with perfect safety.

I am with much respect thy friend, JOSEPH KERSEY.

Editorial Correspondence.

On the usefulness to Farmers of AGRIGULTURAL MONTHLY REPORTS of the state of the weather, and the prospects and produce of the different Crops.

Bedford Springs, August 4th, 1822.

A view of the pastures and growing crops on the road to this place from Baltimore, suggested to me that you would do well to procure from particular correspondents to be relied on

Board of Agriculture. You know that up to ate neighbourhood had been favoured with seathe growth of Indian corn; and hence the general of notice and reflection. impression there that the crop of this grain would be very abundant, and the price low-whereas on my passing even to Reisterstown, I perceived a deplorable difference in the prospects of the Farmer in this particular; from that place quite to Chambersburg, the pastures were literally burned up: the corn not worth gathering-and all nature seemed thirsting for rain. In Gettysburgh, we were told that wells ed, and the water, like every thing else, in the was fit for any thing but to refresh and recruit the "way worn traveller."

One obvious effect to be expected from colcontrivance is placed on the land side of the this-it would tend to prevent ruinous fluctuations in the prices of agricultural commodities. The The ploughman, when he wishes to use it, buyer and seller would meet each other on fairgrasps the staff with his left hand, and drawing it er, on safer ground; advised of the probable average crop, and the extent of the demand, and rid the coulter of whatever had collected their dealings would be adjusted by a scale about it. The spring G, will then restore the upright and staff to their former positions, ready whereas, for want of this intelligence, both particle upright and staff to their former positions, ready ties commonly act under false impressions; thus the merchant is sometimes ruined by a short sighted speculation, and the farmer or planter more frequently injured by having from his retired situation, and more limited means of intelligence, a less extended view of the general products of different crops. Because his immediate vicinity has been blessed with copious rains and invigorating suns, he presumes that providence has shed its blessings alike on every quarter, and sells his produce for half its value before the average product, and the actual scarcity have been developed. If then, I say, you could gather from gentlemen of known veracity, a brief and general statement, from time to time, of the existing prospects and final yield of the several staple commodities, cultivated within the wide range of your paper's circulation, farmers, or at least all of your subscribers, would be prepared to make their own, and a just estimate of the value of what they have for sale; and they would be secured from such mortifications as those which were experienced, this very year, by persons who sold their corn for 22 and 25 cents, and in less than six months saw the buyers sell the same corn for more

THE FARMERS' FRIEND.

P. S. It will give you an idea of the difference of climate, and the progress of vegetation be-tween this place and Baltimore county—to state, that the oat crop here is not yet gathered in; and barley is still quite green, in a field near the springs. I have heard much said of the flavour of the mountain mutton, but no superiority over ours has been perceptible in the quality of that which I have seen. The high and precipitous acclivities, and rough face of the country, here in the mountains, would appear to be the congenial abode for this animal of climbing propensities; and were these extensive orests converted into pasture land, this district would sustain immense flocks of Merinos; and wil-

very recently exhibited the contrivance, before in different sections of the country-periodical dernesses, now abandoned to wild beasts, be Reports, in general terms, of the state and made to yield prodigious contributions to our prospects of weather and crops; somewhat in national wealth. The chief obstacle to be enthe way of the Monthly Agricultural Reports countered is the length and severity of winter; made from different counties in England to the but this might be shortened and mitigated, as it has been on the Atlantic, by the intervention of the time of my leaving Baltimore, the immedithe axe and the plough, as is supposed. You shall hear from me again, after this desultory sonable rains and hot suns, highly propitious to manner, should any thing present itself worthy

> A correspondent residing in Sussex County, Virginia, informs us under date of the 1st of August, 1822, that the Crops were very promising, and that Fruit never was more abundant.

NORTH CAROLINA PEAS.

Raleigh, N. C., 15th July.

"In travelling to Newbern, I have been asked at houses of accommodation on the road (taverns there are none) how many peas I would have given to my horses? If I answered, none at all, I have sometimes been told that they fed with nothing else!! They are reputed very nutritious, but have been known to kill horses not accustomed to their use."

A decoction of the fruit being sprinkled in any place, will drive away mice; it was also said to cure the gout, &c; indeed, so many virtues were attributed to it by the ancients, that if we were inclined to give credit to them, it would cause our wonder to find they had any complaint uncured.

The Romans had also many superstitious opinwho wished for children wore them tied round his kinde." by the midwife, but carried out, in the greatest

haste, after child-birth.

Columella has recorded a variety of wonderful distance from it, it will shoot so much in twentyfour hours as to touch it: but that it will shrink from oil, and turn fairly away from it.

And thirsty cucumber, when they perceive Th' approaching olive, with resentment fly Her fatty fibres, and with tendrils creep Diverse, detesting contact.

Phillips.

CURRANT-TREE.—RIBES. In Botany, a Genus of the Pentandria Monogy nia Class.

This agreeable and wholesome fruit is undoubtedly a native of our country; it was formerly found growing in the wild state, in woods and hedges in Yorkshire, Durham, and Westmor-land, as well as on the banks of the Tay and its being a northern fruit, we have no account of against vomiting. its having been at all known to the ancient Greeks or Romans, who have been very accurate men colour, or champaigne, is cultivated for va-

The Rev. Griffith Hughes, in his Natural His- in describing all the fruits known in their time .edge it not to have been indigenous to Holland, heat. where it was called besskins over zee. Whether Lunan, in his Hortus Jamaicensis mentions the the Dutch first procured this fruit from Britain,

The English name of currant seems to have fruit as big as a walnut, and says it is caten very been taken from the similitude of the fruit to that of the small Zante grapes, which we call currants, or Corinths, from Corinth, where this jelly. reign remedy in various complaints. "The best fruit formerly grew in great abundance, and which are so much used in this country for cakes,

puddings, &c.

The Italians seem to have no other name for

Apples of all sorts, apricots, barberries; boollesse, black and white; cherries, red and black Elaterium was used not only as a purgative, chesnuts; cornet plums; damisens, white and nurtil berries; medlers, or meles; mulberries peaches, white and red; peeres of all sorts eyes, the ring worm, tetter, &c. as well as the peer plums, black and yellow; quince-trees; swelling kernels behind the ears. The juice of wild cucumber leaves dropped and white; service trees; wardens, white and

Currants were not distinguished from gooseberries by any particular name at that period; and even in Gerard's time, they were considered as a species of the gooseberry. He says, in his account of the latter fruit, "We have also in our London gardens another sort altogether without prickes, whose fruit is verie small, lesser by much than the common kinde, but of a perfect

Lord Bacon, who wrote about fifty years after Tusser, has noticed them: he says, "The earliest fruits are strawberries, cherries, gooseberstories respecting the garden-cucumber; and ries, corrans, and after them early apples, early some English authors, of great celebrity, have pears, apricots, rasps, and after them damisons, stated, that when a cucumber vine is growing, if and most kinds of plums, peaches, &c.; and the you set a pot of water, about five or six inches latest are apples, wardens, grapes, nuts, quinces, almonds, sloes, brierberries, hops, medlers, services, cornelians, &c."

Currants are a fruit of great importance in this country: they are so easily propagated, that every cottage gardener can rear them; and they are likewise so regular in bearing, that it is seldom they are injured by the weather. At the dessert, they are greatly esteemed, being found cooling and grateful to the stomach; and they are as much admired for their transparent beauty, as for their medicinal quailities being moderately refrigerant, antiseptic, attenuant, and aperient.-They may be used with advantage to allay thirst in most febrile complaints, to lessen an increased the natives thinking we use them as a dye. secretion of bile, and to correct a putrid and Currant trees produce their fruit on small secretion of bile, and to correct a putrid and scorbutic state of the fluids, especially in sanguine temperaments; but in constitutions of a contrary kind, they are apt to occasion flatulency land, as well as on the banks of the Tay and and indigestion. Brookes says, they strengthen other parts of Scotland. As a further proof of the stomach, excite appetite, and are good

Besides the red and the white currant, the sal-

|riety. The current is a fruit that will ripen early, when planted in a warm situation, and may be retarded so as to be gathered in good condition in the month of November, when they are planted in a northern aspect : thus, with care, a skilful gardener will furnish a dessert of this fruit for six months, without the aid of artificial

Currants will keep for years in bottles, retaining all their qualities for tarts, &c. if they are gathered perfectly dry, and not too ripe. only require to be kept from the air, and in a dry situation. I have found it an advantage to pack them in a chest, with the corks downwards; and if the vacua be filled up with dry sand, it would insure their preservation.

The red currant gives the finest flavour for

The wine made from the white currants, if rich of the fruit, so as to require little sugar, is, when kept to a proper age, of a similar flavour to the Grave and Rhenish wines; and I have known it preferred as a summer table wine.-Even in London this agreeable beverage may be made at less expence than moderate cider can be bought for. Diluted in water, this wine is an excellent drink in the hot season, particularly to those of feverish habits. It makes an excellent shrub; and the juice is a pleasant acid in punch, which, about thirty years back, was a favourite beverage in the coffee-houses in Paris.

The best English brandy I have tasted, was distilled from weak current wine, by a gentleman at Windsor; and I have no doubt but it could be made superior to the common brandies, imported from France, were it encouraged, and certain restrictions taken from the distiller.

The black currants, which were formerly called squinancy berries, on account of their great use in quinsies, are natives of Sweden and the northern parts of Russia, as well as the northern counties of England, where they have been found in their natural state, growing in alder swamps, and in wet hedges by the banks of rivers. In some parts of Siberia, the black currants are said to grow to the size of hazel-nuts. The inhabitants of that country make a drink of the leaves: in Russia a wine is made of the black currants; and it is also made in some parts of England.

The jelly made from these currants is recommended in most complaints of the throat; they are also esteemed cleansing, pellent, and diuretic: an infusion of the roots is useful in fevers of the eruptive kind.

The inner bark of all the species of the currant tree, boiled in water, is a popular remedy in jaundice; and some medical men have recom-

mended it in dropsical complaints.

The currant-tree that was brought from the isle of Zante, by our Levant traders, and first planted in England in the year 1533, I conclude was the vine that produces the small grapes which we call currants, and of which the English use more than all the rest of the world together. This fruit grows in great abundance in several places in the Archipelago. We have a factory at Lante, from whence we import them so closely pressed by treading, that they are of-ten colleged to be dug out with an iron instrument,

snags, that come out of the former year's wood: in pruning, care should be taken not to injure that part; but the shoots may be shortened or thinned as soon as the leaves are off. They require least room, and have a neat appearance, in private gardens, when planted as espaliers; and

the fruit is thought to ripen better.

(To be continued.)

TAXIDERMY, or the art of collecting, preparing and mounting Objects of Natural History, for the use of Museums and Travellers.

Baltimore, July 13, 1822. SIR, I send to you, agreeably to my promise, the ripe, and then put into paper bags, with a note, little volume entitled *Taxidermy*, which I have indicating: just received from England, and which from the cursory examination I have given it, appears to be a very useful vade mecum for those who have a taste for objects of natural history, and are disposed to collect them in their voyages and travels. I should imagine it would be creditable to the government to print a cheap edition of it, and furnish every ship of war, and every exploring party of the military with tribu copies, as it would assist those who might have ities. it in their power to enrich the museums of our Cities with the rarest objects in nature, by teaching them how to obtain and preserve specimens. In sending this book to you, however, I had ing and preparing them. chiefly in view that part of it which teaches the To be certain of the propagating vegetables, may be best preserved and conveyed, supposing you might wish to insert such information in your valuable Jour-

It is gene-The bags containing the grains, well dried, rally sufficient for their perfect desiccation, that ought to be put into a case covered with pitch, the specimens should be separated by several sheets of brown paper. In humid countries and seasons, it is desirable to accelerate their dessiccation by an artificial heat. For that purpose, we put a number of plants between two planks, separated from each other by two or three sheets of paper, and place this packet in a stove a depth of two inches of it at the bottom of a or oven, after the bread is taken out; this quick box, and we range the grains in this earth at method does not even alter the colours. When distances equal to their size; we cover them they are dry, we change the paper. There are with about an inch of earth, in which we put a some plants which are very watery, such as fresh layer of seeds, and proceed in this way bulbous plants, orchida, &c. and which contiand all the products of the vegetable king-dom, which it is possible to preserve and make must take care that the box is quite full of sand, after they have been placed there. When these plants are gathered in the state in which we wish to preserve them, we plunge them for a plants ought not to be considered as an object of the air may penetrate. We make an opening at minute into boiling water, then put them beluxury or curiosity. It is useful to the progress the top, which we cover with a trellis of brass tween two leaves of brown paper; they will wire, to admit the air, without the mice or other afterwards dry quickly, as the action of the boil-animals being able to reach the earth. The ing water will have destroyed the life of the

On each packet of plants of the same species, immediately put them into a proper soil: it is bears in its own country, the height of the coun-Although certain seeds with a hard shell, such tant for the geography of plants, to the progress

Dried fruits should be sent in cases, with a (lauring,) and that of myrtles (myrti,) especi-ticket which indicates the branch of the plant ally when the vessel has to cross the equatorial to which they belong. We do the same by gums and resins. Pulpy fruits should be sent in spirits.

> Herbals and fruits, when they are perfectly and it will be prudent to add a little cotton, imbued with oil of petroleum, or oil of turpen-

tine.

It is also desirable to send specimens of useful versal cut of the tree: but it is most essential to put a number on the wood, corresponding to the branch of the tree in the herbal, for bota-

^{*} M. de Candolle recommended me to pack all servative.

Amongst the objects sent to us, we shall, doubtless, find many which we already possess; still they may be useful. There are plants in our gardens which have degenerated, the seeds of which it is desirable to renew. There are some which, with difficulty, fructify in our green houses, and the seeds of which are not in sufficient quantities to give to all those who request them. Thus, the thormium tenax, or flax of New Zealand, the fibres of which are much stronger than those of hemp, might be plentifully cultivated in several of our provinces, where it succeeds perfectly, although its seeds ripen with difficulty.

are destroyed by time, and which it is useful to gustura.

Besides the collections of living vegetables, plants preserved in herbals, and products of the vegetable kingdom, the Museum possesses an assortment of tools, machines, utensils, and substances, employed in gardening, in agriculture, and in rural economy. This assortment, already very rich in the implements of the different nations of Europe, still requires the tools, &c. of other parts of the world. They would be received with pleasure and gratitude.

BOTANY.

General Observations.

The nearer we advance to the equator, the larger we find the plants. The most commodious size for the paper of the herbarium is from fif- put to dry in places which are neither too dry, teen to eighteen inches long and eight or ten nor too warm, to prevent them from splitting. wide. We should be provided with several planks of the same size as our paper; these planks should be formed of two thinner ones, planks should be formed of two thinner ones, their surfaces being glued together; so that the grain of the wood of one may go length-ways, and the grain of the other breadth-ways, and without this precaution they are apt to break. We must have either a press, or a proportionate number of straps with buckles at one end, which will serve to press the packets of blotting-barium, or dried apart. Ferns, mosses, alga,

The rose laurel (nerium. Fam. apocynex,) paper between the two planks. We should hich affords a beautiful dye. We should ting-paper, with a loose back, shut with little straps, and capable of being carried into the form of a knapsack. This book and box will serve,

during a journey, for a temporary herbarium.

When we are stationary, we take the plants from the book or box, and place them in sheets of dry blotting-paper; between each sheet con-The vessels which go to Martinique and Cayenne, having, as we have already said, frequent communications with Terra Firma and the Wa overhead to characteristics. The plants preserved in herbals, which we already possess, may be employed in making exchanges with other countries, and thus establish one nomenclature.

communications with Terra Firma and the with Communications with Terra Firma and Terra Firma and the with Communications with Terra Firma and Terr Gums, resins, dye-woods, vegetable productions employed in medicine, can be analysed, and positive information given on objects which are now but imperfectly known. We must allow that, notwithstanding all our care, there are always some objects amongst our collections which ways some objects amongst our collections which seems and which it is useful to construct this process, we must be very careful to change the intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets, and always leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets and leaving the plant in that in which it was first placed; but in this case the number of intermediate sheets and placed; but in this case the number of intermediate sheets and placed; but in this case the number of intermediate sheets and pl this process, we must be very careful to change

more advantageous to leave them in their husks without sifting them; but when the fruit is fleshy,

we must separate them.

When fruits are dry and coriaceous, they do na of the trunk of the moriche palm, celebrated not require any other preparation than being amongst the Guaraunos Indians. A branch with preserved in a dry place, not exposed to the sun: and those whose valves open with desiccaor quinquinna of Caroni (cortex angusturæ.) tion, must be tied round with a piece of strong

> ter, we may choose a middle-sized branch for a specimen, if it does not differ from the trunk; but if it does, we cut the trunk longitudinally, so that we may have one-half or one quarter of its circumference, but always from the pith to the

> When we meet with palms, ferns, or any other monocotyledonous tree, we should procure a stump of a foot long, whatever the diameter may be. If the palm be branchy, which is very seldom the case, we must cut the trunk six inches below the ramification and six inches above. Travellers are particularly requested not to neglect any opportunity of collecting palms, tree ferns, dragon-trees (draczna,) pandanez, or trees similar to these.

> In cases where it is impossible to have a portion of the trunk sufficient to convey an idea, of its size, as the baobab, or the ceiba, we must take an exact note of the dimensions. The specimens of wood, when fresh cut, should be

> Roots are only worth the trouble of collecting, when they present any thing remarkable in their structure, and then we take the same precautions

ought to be dried and put into an herbarium. If time be wanting, the mosses may all be mingled together, and arranged after their arrival.

to pay great attention to the collecting small Implements and Domestic Manufactures, have eryptogamia which spring on living vegetables. The greater part of the spots or excrescences which we see upon leaves, stems, or fruits, are which we see upon leaves, stems, or fruits, are worthy of being gathered and preserved. In this to the owners of the best kinds, that is to say :case, we ought to gather the leaf charged with the parasite, and a branch in flower of the

same tree, to know its species.

Travellers will render an important service to science, by carefully collecting the monstrosities or permanent accidents of vegetables; such as the natural union of the organs of the same plant, which are generally separate; the organs which are abortive or altered in their form, their number, or appearance. These cases being out of the general rule, we cannot prescribe any precise method for their preservation; we can only observe, that at the side of each monstrous or diseased specimen, another ought to be added of the same species, in its usual state, to serve as a comparison.

By the side of our drawings, it is desirable to place a sketch of the general appearance of the whole individual; and if it be a tree, to add a

scale of the size.

In our descriptions, if accustomed to the tech-nical details of botany, we should be careful to note those particulars which are not easily seen in an herbarium, such as the exact insertion of the parts of the flower and the fruit, especially when the organs are very small; the precise construction of the grain, &c.

In climbing plants, when any species are found which resemble European, it is particularly necessary to notice which way they twist around their snpport; the traveller, supposing himself in the place of the support, his face F turned towards the south pole, to ascertain if they ascend from right to left, or from left to

lers, the upper edge of which, a, is sharpened for cutting specimens of the wood from the trunks or larger branches of trees; b, edged for severing the branches out of reach; c, blunt for hooking them down, for the sake of the leaf, fruit, or flower. A statement of the manner of preparing the cream and butter will be desirable.

The above premiums will be awarded only for 15 animals bred within the State of Maryland, or within the District of Columbia. But male ani-15 mals of the several kinds above specified may be 10 entitled to premiums, though bred out of the 5 State and District, provided the owner of such male animal shall secure his continuance in the State of Maryland, to be bred from, for one year from the granting of the premium.

It is to be understood that whenever a premium for any specimen of Agricultural Implement, piece of Machinery, or article of Manufacture, may be claimed merely from the want of compe-15 tion, or where the thing presented for premium d 10 shall be considered as possessing no merit worthy of encouragement, the Judges shall have a right at their discretion to withhold such premium .-But this regulation shall not extend to Live Stock, as the best offered will gain the premium without any exception.

In no case will a premium be given for Live 15 Stock, unless the owner shall have notified Mr. 10 Samuel T. Kennard, of Easton, of his intention 10 to offer for the same, and shall have entered the particular animal with him ten days previous to the Exhibition, stating himself to be the owner of such animal, and the manner of feeding and rearing it, together with its pedigree, disposition and other qualities as far as practicable.

Persons having fine animals, though not intended to be offered for premiums, will gratify the Society by exhibiting them in their field. And for the purpose of preparing proper arrangements, and stalls, for the accommodation of all stock offered for premiums or for show, it is requested that all persons intending to offer stock for show only, as well as those offering them for premium, should give notice to Mr. Kennard, of such intention at least ten days prior to the Exhibition.

All Premiums awarded by the Committee of the sum of ten dollars and upwards shall be distributed in articles of Plate; and Premiums below the sum of ten dollars shall be distributed in money or medals: and the Committee, to whom the charge of these regulations shall be entrusted, shall determine the nature and devices of the plate and medals so to be distributed.

Sales of the Stock and articles exhibited, will take place on the second day either at public or at private auction.

By order of the Committee N. HAMMOND, Chairman.

SAMUEL T. KENNARD, Secretary. Easton, August 13th, 1822.

Editors of papers in this State and the District of Columbia, who are disposed to promote the interest of Agriculture, are respectfully requested to insert this notice in their respective Journals

Selections from late numbers of the London Farmers' Journal, received at the Office of the American Farmer.

Kinlet Agricultural Meeting and Sale took place on Monday, the 1st of this month, of which the following particulars have been transmitted to us :- None of the New Leicester Ewes or but the North Devon Cattle found ready purchasers at good prices; a proof of the estimation in and Old Phænix the dam of Favourite; Favour-tunately one article, which its original owner had and Old Phænix the dam of Favourite; Favour-tunately one article, which its original owner had and Old Phænix the dam of Favourite; Favour-tunately one article, which its original owner had highly valued, was left behind, on account of highly valued, was left behind, on account of the same age, as high as £37 a pair. Mr. Childe's et was full of Hubback's blood, and was of course the same age, as high as £37 a pair. Mr. Childe's et was full of Hubback's blood, and was of course draft of Devon Cattle only, amounted to upwards of a mixed breed. ALLITERATION.

The admirers of alliteration will be pleased with the following character of a young lady, from an old Newcastle Journal: - " Died, in the page 393, is the following passage:—"York-shire is famous for the Holderness or short-horned cows. This large breed came originally from two instances in our recollection which approach Holstein and the low countries, and were until near to the above: the one is, "Henry Hallam, of late years too coarse and Dutch built; they hatter, hosier, and haberd-sher, at Holborn-have been much improved in symmetry, and bridge, Hatton-garden;" the other "Benjamin fineness of home and flesh by a judicious cross Rell brown hread and huiscuit baker, peer Rel Wolsey, better than either :-

Begot by butchers, but by bishops bred, his garden, at his seat of Elford Hall, in Staf-

Theaves sold for more than two guineas a-head; jambee was the sire of Old Phænix and of Lord on Friday night se'night, and the carpet and vabut the North Devon Cattle found ready purcha-Bolingbroke. Lord Bolingbroke was the sire rious articles of furniture taken away. Very for

gin. Mr. Bakewell, I believe, has let a ram of ly valuable. Such an establishment requires onthis breed for 1000 guineas the season.

Thus then I have given your correspondent H. ly the investment of a small capital, and the attendance of only two negroes, working under ly the investment of a small capital, and the In answer to your correspondent whose letter appeared in The Farmers' Journal of the 25th two striking and I need not, therefore, add another word inst. under the signature H, I beg to assure him that I shall be happy to impart all the interesting in the subject.

I will not quarrel with your worthy corresting the few hands which are worted and the few hands which are worted and the few hands which are worted.

two first leaves in 6, 7, or 8 weeks, according to more or less rain received.

That young tree will require an easy attendance during the three or four first years, to prevent its taking a bent, and forking or branching out too soon. Often also, the slender stem will want that a prop or guide be given to it, in order that it may grow straight and of a proper shape.

When 6, 7, or 8 years old, it will yield from 25 to 50 oranges.

When 9, it will yield 100 and upwards, and thus go on increasing every year.

When 15, it will yield from 5 to 600 oranges, and

When 20, which is its prime, though not its full growth, 1000 oranges.

When 30 years old, it will, if having always been thriving, yield from 1600 to 2000, and so go on increasing with age till it will yield as many as 6000 oranges, every fruitful year, as many trees do in this province. That tree lives generally here 100 years, or a little more, and then decays

gradually.
4. Oranges sell here generally at 10 dollars a thousand, in September and October, and at \$12 50 cts. in November and Decem-

ber. 5. Were the owner to have his oranges boxed up properly, (only 200 in a box, in which state they would keep 3 months) and exported to Philadelphia, New York, or Boston, he could always count upon an average sale of from 15 to 20 dollars a thousand, all expences paid, and all deductions made for the oranges which

might be rotten. He could also gain always trom 5 to 10 per cent, on the em-ployment of his funds being sent back here.

 A square of 6 acres (261,360 feet, or 510 feet square) will contain 400 orangetrees, planted in 4 clusters, A, of 100 each, at 20 feet distance from each other, and for a two story dwelling-house, B, 54 feet long, North and South, and 18 wide inside for three rooms above and two galleries in the length way of the house; space also for four walks, C, 80 feet wide, from the four gates F, to the house, and a walk D, of 34 feet wide in four directions along the four fences, (leaving one foot for the fence) and consequently surrounding the four clusters above mentioned of 100 orange-trees each.

each side of these walks, grape-vines, young orange-trees from seed and for sale, and all kinds of vegetables may be planted, and yet leave a convenient road in the centre for the carts to move in. Vegeta-bles may also be planted in beds, 6 feet wide, taken out of the centre of each North and South walk which is between the trees, and there are thirty six such walks.

Each of the four clusters, of 100 trees each, ought to have a well, E, in its centre, the dwelling house, of course, must have one

The lower part of the house, (after re-serving two rooms for cooking and for washing and ironing,) ought to be kept for receiving, drying, and packing up the crop: also to lodge the overseer and the labourers: to shelter the carts, and a chaise if used: to store the implements of horticulture, the lumber for the boxes for oranges, to receive the benches of the carpenters making them, the boxes made, &c.

The stable for two horses and two cows may be built against the fences, and also some

lodging rooms, for the people.

The dwelling-house, and out houses, the stable, &c. ought to be built only with the proceeds of the sale of the oranges. The ground and its fences only ought to be bought and made at first, with a small house of 100 dollars for the overseer, and one hut or two for the labourers, until the orange-trees yield a crop.

7. Such a grove as this, would, when the 400 trees become twenty years old, (and supposing them to be in a thriving state) yield at least 3000 dollars a year, and if the fruit was exported with due care —from 4 to 4,500 dollars, without reckoning the proceeds of the sale of the grapes, young orange-trees, and vegetables, which might be raised at the same time.

8. An intelligent and industrious man, something of a gardener, with two or three negroes,

FOR THE AMERICAN FARMER.

ON DEBARKING FRUIT TREES. Nottoway, July 18th, 1822.

DEAR SIR. In your 13th Number, I notice some observawill suffice to attend such a grove, and also tions on the subject of barking fruit trees. If the the garden, except in the time of the crop following experiment can be of interest or amuseof the oranges, when a greater number of hands will be wanted during two or three though not conducted by myself, I have frequent-days, from time to time to gather the fruit. better plan than that of raising such a grove from the seed, would be (as small myself for its correctness and accuracy. In the sweet-orange trees cannot be procured summer of 1816, there were several apple trees here) to plant 400 straight and healthy growing in his yard, which had been transplanted sour-orange trees of four or five years of about three years. Having heard from some age, (which are abundant here) and in-source that a tree barked under particular cirgraft on them the buds of such China cumstances, would not only not die, but would be orange-trees as are known to yield very improved by it, he was induced to test it on one This would advance the crop four or five Accordingly on the 20th of June he very careful-that they will be improved by it. In this case

ly stripped it from the limbs to the ground, laying bare the whole extent of the body. The utmost care however, was taken to prevent the knife from wounding the delicate fibres of the wood .-Not a leaf withered, nor did the appearance of the fruit, or any other circumstance indicate the least deterioration.

It was very soon apparent that a smooth and delicate skin was supplying the place of that which had been removed, and which retains its smoothness at this time. Acquiring confidence from his late experience, he ventured the subsequent June to repeat the operation on the remaining trees on that side of the yard with similar results. The trees are very flourishing, and the fruit very good, as I had an opportunity of witnessing to day.

Though this experiment fairly proves that the trees will not be in the least injured by this manof his, the fruit of which was not much admired. agement; yet it by no means establishes the fact

00 TUNISIAN SHEEP.

We have great pleasure in recording the following authentic history of an importation of Tunisian Sheep, and we particularly desire that our correspondents would furnish us with accounts, as detailed, respecting every importation of Live Stock, which has come within their knowledge; and especially, when the facts so conclusively demonstrate the tendency of agricultural pursuits and subjects to inspire all who embark therein, with a liberality of feeling and design which, so far from admitting the idea of venal rivalry or sordid monopoly, bid every one generously welcome to the fair enjoyment of new sources of profit.

Belmont, August 14, 1822.

DEAR SIR,

In your paper of the 2d instant, I see queries respecting the Tunis Broadtailed Sheep. " How many were received? and were any sent

into other states?" I have given a full account of these sheep in them. I am the only person acquainted with opinion, during the Merino-fever. the whole subject, to which I do not mean to

rating with me.

ferable to the coast sheep, they were procured also diminished the multiplication of the breed. by Gen. Eaton, (as he informed me,) off the Yet I was surprised by the information I fre-

try the benefits of such acquisitions; I refused but into the neighbouring states; at no small trouble and expense to myself. Several victuallers, finding the superiority of the mutton over that of all other sheep, both in quality and price, made up a purse and offered any sum I chose to fix for the Ram. I refused the proffer; and after his covering, during several seasons great numbers of ewes sent to my farm; and there canda. pastured and served without charge; he was conveyed to my late friend, Gen. Hand's farm, near Lancaster; where he was killed by dogs; after propagating the breed extensively. The ewe met the like fate, on my farm; having yeaned a healthy lamb, at sixteen years of age.

Chancellor Livingston's sale of two Merino sheep for \$3000, gave impetus to the ardour which had begun to operate in favour of that breed. Had he given them away, the effect would have been far otherwise, on the minds of both farmers and speculators. Voila les hommes! Fancy paints profits in proportion to price paid. Small gains are counted on gifts, or cheap pur-

chases.

Discovering the impolicy of continuing (however beneficial my distributions may, at first, have been,) gratuitously to bestow lambs; and of my other modes of dispersing the breed without charge; I encouraged my neighbour, Thomas Bones, in raising fine Broadtailed Sheep, from my stock, for sale on his own account. He the 2d volume of the Philadelphia Agricultural did great justice to my confidence in him; and Memoirs. My opinions continue unaltered; and sold considerable numbers; many whereof, at I had supposed the subject to have been exhausted. I have no desire to revive it, farther than to answer your queries as fully as historical facts require; and that with no personal objects. I do not relate the circumstances had for them; though those prices were mode-to blazen my own eventions; but makes a rest indeed; compared with these of Many were rate, indeed; compared with these of Many were really enhanced by the prices were modeto blazon my own exertions; but under a per-suasion that a useful moral may be drawn from which overwhelmed the *Tunisians*, in public

PUBLIC LANDS,

Appropriations of, for the purposes of EDUCATION, in all of the UNITED STATES.

We some time since received a copy of the proceedings of the Massachusetts Legislature, in reference to the Maryland Resolutions on the interesting subject of providing adequate funds, in all of the United States, for the purposes of Education, by appropriations of a small portion of the public lands; and we would have published it before now, if we had not lost our copy. When we first missed this, a friend and neighbour promised us the use of his copy, and some reflections which he had made on the subject, whilst he was reading and compar-ing the two reports. We freely accepted his offer, and now give place to the Massachusetts proceedings and our neighbour's notes; these must clearly elucidate the Maryland proposition, and they oppose to the Massachusetts objections, most powerful reasons for its adoption.

At the first blush of this project it appeared to us so fair, and its object so commendable, that we gave to it our ready approbation, nor entertained a doubt as to the justice of the Claim, until its opponents alleged, that "fi'r " the school lots reserved in the New States an " equivalent consideration had been given to the "Nation by the purchasers of public lands:" but the examination of this point, so far as we have yet been enabled to carry it, leaves upon our mind the most distinct conviction, that an equivalent price not only has not been received or stipulated, but also, that it never was supposed, by the purchasers of public lands, that they were either paying or promising one.

We thus frankly submit the matter to the consideration of our readers; who will feel a lively interest in the progress of a discussion that connects itself so immediately with the all important subject of general education.

The words of

"Resolved by the General Assembly of Mary-

to amount to between four and five hundred amount, if appropriations of land for the purposes millions of acres, the inference is drawn, that of education, had heretofore been made in favor of the total of literary appropriations, in the new one state only, instead of all the states and terristates and Territories, will be 14,567,569 2-3 tories, formed out of the public lands, and has no acres. At \$2 an acre, the amount in money, connection with, or defendence upon the entire will be \$20,153,130,130. will be \$29,153,139 1-3. Then, considering it quantity of those lands. It says to Congress, as proved, that these appropriations to the new "you have made grants of land for the promotion States and Territories, does furnish a valid of education to some of the states; make similar claim, in justice to the excluded States, to an grants, and in a just proportion to some of the othequal quantity of land, in proportion to their ex- ers." This demand could have heen made with tent of territory, the Legislature of Maryland equal propriety, if Louisiana had never been purchased of France.

If indeed, it can be shewn, that the states, which to decide what that just proportion is.

by the war, more especially that portion of them, come to the conclusion, that 9,370,760 acres of which was due for military services.

Subsequently, that vast tract of territory included under the name of Louisianna, and more cluded under the name of Louisianna, and more the claim set forth by the State of Maryland, in behalf of herself and the old States.

Year, to furnish coarse pasturage to immense herds of wild animals, but would be of little value were it even nearer to places where some settlements have been made. If these lands can be taken into the amount, for the purpose to be of equal value, we cannot perceive why it would not be equitable to satisfy our claim out of the same lands. But the grant of a few hundred, or even a few millions of acres, upon the upper brances of the Yellow Stone River, along under obligation to survey them for a century to come. It is also to be considered, that a great part of the lands stated to belong to the United States, more especially those beyond the Mississippi, are still held by the Indian tribes, in expressly made, and a violation of the spirit of have been seen, it may be taken to consist full property, from whom the Government must our national compact, as well as the principles mainly of vast plains, without wood, scantily purchase, before they acquire any right to sell

It seems scarcely necessary to remark upon the extraordinary fallacy of fixing the price of two dollars an acre, upon those vast tracts of waste and unsettled territory. (3) It is true that this is, or rather heretofore has been the price affixed by Congress to the Public Lands; but it is to be considered, that the expenses of sucveying, and those attending the costly machinery of the land office system, are wholly borne by government; that although two dollars is the gross price, yet with the credits and discounts for prompt payment, it amounts to about three quarters only of that sum, and more especially, and this circumstance wholly distinguishes the two cases, that the lands thus sold for two dollars, lie within settled States and Territories, and are in immediate and present demand, for the purposes of actual settlement. And it is this exaggerated estimate, which has led the Legislature of Maryland to the startling conclusion, that the grants or reservations in favour of the new States and territories, may be estimated to amount in value, to the enormous sum of nearly thirty millions of dollars. This sum, we believe, is more than all the monies ever received from the sales of the Public Lands, from the commencement of the grants, to the present time, a period of thirty five years of unexampled activity and enterprize; during which, settlements have been formed, and a population has grown upon these territories, with a degree of rapidity entirely without parallel in the history of the progress of society.

It is, however, truly observed by the Legislature of Maryland, "that the magnitude of the appropriations which equal justice requires, cannot be considered as a reasonable objection to them." But your Committee are of opinion, that the magnitude of a claim, urged as a demand of right, furnishes a good reason for bringing it to the test of strict inquiry, to as-certain whether it is in truth founded upon those principles of equal justice upon which

it is asserted.

(3.) Have not the Massachusetts' Committe again misapprehended the Maryland Legislature? It appears to us, that the calculation, which they consider exaggerated is not intended as an estimate have fallen into an error in supposing, that the have received grants, have fail a consideration for of the present, but the future value of the school Legislature of Maryland "entertain no doubt" them, then the matter is somewhat modified—but reservations, as is clearly indicated by the use of the "speedy sale" of "every acre" of the fub-surely the other states have a right to ask of future tense. And is it extravagant to suppose, that lie lands. We have carefully examined the Ma-Congress, similar appropriations on condition of the school lands, when surrounded by a population lic lands. We have carefully examined the Malic lands. We have car moment worth more than twenty dollars per acre

^(1.) The Massachusetts' Committee appear to gant and absurd.

the use of Schools, are to be justly regarded as ject correct, in regard to States already formed, gratuity. ground can it be extended to the unnumbered Public Lands sold, is reserved for Schools, your ple of the United States. If, therefore, the pro-States, existing only in anticipation, which may, at some future time, be formed out of these va-wise and judicious. Whilst it serves to encour-into the common property of all the peo-ple of the United States. If, therefore, the pro-ceeds of these lands, thus raised in value, go wise and judicious. Whilst it serves to encour-into the common treasury of the United States, an approach? A grant implies parties; there arises, by the increase of families within the not cease to be a citizen of the United States, by

sideration for the privilege, in the price given for the land, to which such privilege is thus anticipated this objection, and endeavour to an-previously annexed. The United States as proprietors of a township thus surveyed, offer it entitled to a grant thereof in fee, and the United States will forever hold the thirty sixth section in trust, for the use and benefit of such purchasers and their assigns, for the support of Schools. When land is taken at this offer, the contract becomes complete, and the United contract becomes complete, this trust with fig. delity; and it would be a manifest breach of faith, to compel such purchaser, in any shape, to pay a further equivalent for the privilege thus stipulated and paid for. But it would obviously be compelling such purchaser, thus to pay again for this benefit, if in consequence of such reservations, other lands or other funds, should be appropriated to the use of all other citizens of

But can these reservations be justly consi- privilege to lands, does not enhance their value, dered as grants or donations to any State within and is not ordinarily taken into consideration by to his share in its capital. (5) which they lie? A system for the survey and purchasers. Such an assertion, however, we sale of the Public Lands has been adopted, ori-think would be entirely unwarranted. It may Constitution, and modified by sundry acts of Congress. According to this system, lands intended to be sold, are surveyed before they are offered for sale, being actually divided into townships six miles square, and these subdivided into thirty six sections, each one mile are known, enjoyed, and appreciated, its effect square, and containing 640 acres. One of these is produced in that general aggregate of the unless some local advantage not common to othsections, in each township, is uniformly reserjudgments of men, which constitutes the marved and given in perpetuity for the support of ket price, and fixes an average estimated value schools in the township. This plan being to such property. It is probable, therefore, that office fees, were there no price prescribed by law, edented and made known before the town by enhancing this market price, and raising the below which they should not be sold? adopted and made known, before the town-by enhancing this market price, and raising the ship is offered for sale, it is manifest that general estimate of Public Lands by the reserevery purchaser, whether he take the whole vation of the school lot, a full equivalent is ob-

Maryland does not propose, as the Massachusetts for the encouragement and support of schools and Committee suppose, that the school lands, if granted to the states, which have received none will increase with it;—an advantage incident to heretofore, or the proceeds of them, should be the local situation of the new states, carved out distributed amongst them according to "extent of the public lands, which cannot be extended to of surface;" and we agree with that Committee, the old states; for, when the lands appropriated that "extent of surface, can," in those states to their benefit, shall once be sold, the fund be-"furnish no safe or equitable rule of distribution." comes fixed and cannot increase. The case, however, is different in the states form-The case, however, is and so. Extent of surface in in form they are proportioned to territoriat extent, ed out of the public least guide for arriving at an operate beneficially in a "just proportion," activities distribution, in reference to population, cording to population, and of course as respects the subject of education. Let it be borne in mind, those states, in entire conformity with the spirit that the school grants in these states are reservation of the condition of the cessions, by Virginia and the school grants in these states are reservative of lots number 16, in the censor of the condition of the censor of the public and the school grants in these states are reservative of lots number 16, in the censor of the condition of the censor of the public and the school grants in these states are reservative of lots number 16, in the censor of the condition of the censor of the public and the school grants in these states are reservative of lots number 16, in the censor of the condition of the censor of the condition of the censor of the public and the school grants in these states are reservative of lots number 16, in the censor of the condition of the censor of the condition of the censor of the public and the school grants in these states are reservative of lots number 16, in the censor of the condition of the censor of the censor of the censor of the public and the school grants in the The case, however, is different in the states form-ed out of the public lands. Extent of surface in in form they are proportioned to territorial extent, tree, Phanix Dactylifera. In Botany, of the enure to the benefit of the states, "according to sold. Their value, as a fund for the promotion of education, depends upon the rent which they will bring. In unsettled townships, they will bring none. In townships, thinly settled, where land in fee simple can be purchased cheap, they will bring but little. But they will command a high rent in townships thickly settled, where of course the price of land in fee simple will be have determined the aggregate amount of land, high and rentable land of course in demand. In short, caleris paribus, the rent of these school them and the other states, would be a Ratio, comshort, caleris paribus, the rent of these school them and the other states, would be a Ratio, comlots will be in proportion to population—their hounded of actual population and territorial exvalue therefore, as a fund for the support of tent, weight being given to territorial extent, on and other inhabitants of the desert, where the schools, will be in proportion to population, an account of future population.

It is hardly to be presumed, however, that it is annexed, and of course, co-extensive with entirely different character, upon which your

many sellers coming into the land-market at founded on the suggestion that donations of lands confidence in the result of their enquiries, had many sellers coming into the land-market at rounded on the suggestion that donations of lands, but only depreciate the value of their lave been made to certain States, for the support of Seminaries of Learning of a higher grade, proposed by the United States, and divert that source of revenue from its present channel, for many years to come. To avoid this granted for this purpose to several States and ruinous system, it would, probably, be proposed reintous extending the proposed recommendations of lands confidence in the result of their enquiries, had not opinions of an opposite character been experted by the support of Seminaries of Learning of a higher grade, present by the proposed them to examine the suggestion that donations of lands confidence in the result of their enquiries, had not opinions of an opposite character been experted by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learning of a higher grade, present by the support of Seminaries of Learnin to pay in cash, a certain proportion of the pro- of the circumstances attending which, and the have influenced them, at much greater length ceeds of the sale of Public Lands. But in this considerations upon which they were made, your than would otherwise have been proper. But case, it would be necessary to replace the same Committee have not been able to obtain precise believing that the proposition of the Legislature sum from other funds, so that in point of fact, it and satisfactory information. They are, how-of Maryland cannot be sustained upon just and would be quite immaterial whether these sums ever, so unimportant in point of amount, as not were paid out of those proceeds specifically, or materially to affect the general question. If the from any other public monies, being in either case, a general charge on the treasury. Whether land therefore, or money, be distributed, no of a character to sustain the present claim in best interests of the Union, they ask leave to recommend the adoption of the subjoined resolutions. They are, now is attisfactory grounds, and that the adoption of it by this Legislature, would be attended with consequences, highly injurious to the harmony and best interests of the Union, they ask leave to recommend the adoption of the subjoined resolutions. other equitable rule of proportion can be followed, half of the old states, the proposition of the State than that of contribution to the general charge, because in either case, the amount thus taken, must sire to promote the great object of school educations. be replaced by such contribution. Nor does it aption, will not be sufficient to justify an affirmative pear of the slightest importance whether those decision on this proposition. It is a question of who are entitled to receive, happen to be closely strict right, between parties having adverse United States, are justly considered to be the settled on a small surface, or thinly scattered over interests, the decision of which may involve common property of the Union, and that no State settled on a small surface, or thinly scattered over interests, the decision of which may involve an extensive territory. Extent of surface, therefore, can furnish no safe or equitable rule of distribution. But it is, perhaps, easy to perceive the error, in which this proposed ratio of distribution arose, and to trace it to that general delusion, if the expression may be indulged, in which this extraordinary claim itself originated. The aggregate of these school reservations, being a strength of the decision of which may involve common property of the Union, and that no State can justly claim any exclusive appropriation of them.

Resource, That the reservation of certain lots of land in townships offered for sale by the Unittownships, in pursuance of standing laws, cannot justly be considered as a donation to the States
within which such lands are situated, and cannot. aggregate of these school reservations, being a and sixty-nine Representatives in Congress; the portion of each township surveyed, for sale, must former feeble, having only seventeen Representative therefore, entitle any other State to demand any of course, be in exact proportion to the number of these townships. As a benefit promised to purchasers, this was the just proportion. Had such these Representatives, having themselves, chasers, this was the just proportion. Had such the question. As a question to the question of the foreservation been designed principally as a gift or between parties thus situated, it becomes an of the several States, with a request that they will gratuity, to inhabitants or settlers, independent of imperious duty to waive all considerations of their interest in the lands, a different proportion interest, policy and expediency, and to decide would naturally have presented itself. (11.) This only upon those unerring principles of justice, circumstance throws additional light upon the which can alone ensure harmony and safety .-The question, whether Congress has power, and whether under any circumstances, it would be (11.) POMARIUM BRITANNICUM,

An Historical and Botanical account of Fruits, known in Great Britain, by Henry Philips.

fruit forms a principal part of their food, particu-

In this part of the world, forests of date-trees attention, and is very profitable, the fruit being may be seen, some of which are several leagues in great demand, particularly that in the neighbourhood of Rosetta, which is delicious. The thors have given full accounts of this fruit. It is branches are cut off with the dates upon them there is a the property of such a delicious great demand, particularly that in the neighbourhood of Rosetta, which is delicious. The branches the farina of the male brought thither by the wind. It may appear to many persons almost incredictes of such a delicious quality many who before they are thoroughly ripe, and thrust into

The Babylonian, or Royal Dates, were most brought to England in this state? esteemed: these, in ancient times, were reserved for the kings of Persia, and are said to have corruptible by the natives. It is used for making kind only; else, when a variety of flowers were grown only in one hortyard or park at Babylon, beams and implements of husbandry, as also for blossoming at the same time, we should have ed for the kings of Persia, and are said to have corruptible by the natives. It is used for making kind only; else, when a variety of flowers were grown only in one hortyard or park at Babylon, beams and implements of husbandry, as also for which was annexed to the Persian crown. The javelins, and the trees often grow to a hundred dates at Jericho, in Jewry, were also in high estimation with the ancients, who made both bread are used for so many valuable purposes, and I animals and insects, when left to nature, couple and wine of them. Pliny, who has written at great know of none where the sexual distinctions are length upon this fruit, mentions forty-nine kinds so evident. It is the female tree which produces though it is now clearly ascertained that it is they grew; some of which were white, black, greater numbers; but in order to obtain the fruit, ceive the pollen of another, if it is prevented or brown, some were round, others in the shape the orientalists, who live upon it, plant male from taking that of it's own species; and thus or brown, some were round, others in the snape the orientalists, who live upon it, plant male from taking that or it's own species; and thus of a finger, some very small, and others he describes as being as large as the pomegranate.—
their enemies, in time of war, to cut down the variety of new flowers and fruits.

The date tree grows very rapidly, and will cultivated in Italy, and is by some supposed to ducing dates, and causes famine. The number of produce fruit in some countries in the third year, be the fruit by which the companions of Ulyses female trees cultivated in Asia, is much greater while in others it is from four to six years before

caused him to state that they were foreign trees. The Arabs eat dates without seasoning, for they have a very agreeable taste when they are fiesh, and afford wholesome nourishment.—
These people dry and harden them in the sun, to reduce them to a kind of meal, which they preserve for food when they undertake long journeys across the deserts; and they will subsist a considerable time on this simple nourishment: pieces of the date-bread diluted in water afford a refreshing beverage. The Arabs likewise strip the bark and fibrous parts from the young date-trees, and eat the substance that is in the centre. It is very nourishing, and has a sweet taste, and they call it the marrow of the date-tree: they also eat the leaves when they are young and tender, mixed with lemon-juice, are young and tender, mixed with lemon-juice, are young and tender, mixed with lemon-juice, are speaking of the date-trees are seased in the strunk of each branch which they wish to produce fruit, and place in it a stalk to they wish to produce fruit, and place in it a stalk of male flowers: without this precaution, the date-tree would produce only abortive fruit. In some parts the male branches are only shaken long bounches from the trunk of each branch which they wish to produce fruit, and place in it a stalk of male flowers: without this precaution, the date-tree would produce only abortive fruit. In some parts the male branches are only shaken long bounches from the trunk of each branch which they are seed is poor and ill-tasted, while those trees which are reared from the shoots, give dates of good quality.

The flowers of both sexes of both sexes of both sexes of both sexes come out in very sowe the shoots, give dates of good quality.

The flowers of both sexes come out in very sowe the same flowers; which stalk those trees which are reared from the shoots, give dates of good quality.

The flowers of both sexes of are young and tender, mixed with lemon-juice, Plantaus, in his Dissertation on the Sexes of Plantaus. The male flowers are also eaten, as a salad. The male flowers are also eaten, when tender, in the same manner. The fruit before it is ripe is somewhat astringent, but when the roughly mature is of the nature of the fig. thoroughly mature is of the nature of the fig.-A white liquor, known by the name of date-milk. is drawn from the palm-tree. To obtain it, all the branches are cut from the summit of one of these trees; and after several incisions have been made in it, they are covered with leaves, in order that the heat of the sun may not dry it;

Père Labat, in his Account of America, mender that the description of the sun may not dry it; the liquor. The milk of the date-tree has an tinique, that produced a great quantity of fruit, agreeable sweet taste when new: it is very refreshing, and is given even to sick people. Thus has Providence reared a blessing in the sandy desert for the wanderer.

Even the stones of dates, though very hard, are not thrown away; they are bruised and laid in water to soften, when they become good food for sheep and camels.

The Egyptians make an agreeable conserve of the fresh dates and sugar. The Arabs weave mus, who relates, "that, in his time, there were has it's blessed palm-branch. The dates seldom two palm-trees, the one a male, the other a feripen so thoroughly as to keep well. old leaves; and from the filaments which arise male, in the wood Otranto, fifteen leagues apart; from the stumps of the branches, they fabricate that this latter was several years without bearing speaking of the date-tree, says, "The straightest both ropes and sails.

Italy, and the coast of Spain, have been re-profitable.

makes no change, but remains in the same state nowned for palm-trees more than two thousand. The sexual organs of the date-tree grow upon for three generations, according to the account

which they are principally used in England, being considered hard of digestion, and often causing the head-ache to those who eat them in quantities, and they create scorbutic complaints as well as the loss of teeth. In medicine, the qualities of dates are to soften the asperities of the throat, to assuage all immoderate fluxes of the stomach, and to ease disorders of the reins, &c. The oil and phlegm render them moistening and good to assuage coughs. They stop vomitings and fluxes, and are good for the piles when taken in red wine. (Barham.)

They are principally brought from Africa, Egypt, and Syria, but the finest come from Tunis. Near Elete, in Spain, there is a wood consisting of two hundred thousand palm-trees, bearing dates. These trees furnish a curious traffic: bleach the leaves, which in time become white; they are then cut off, and sent in ship-loads to Genoa and other parts of Italy, for the grand procession of Palm Sunday. There is a great trade in them with Madrid also, where every house

Hughes, in his Natural History of Barbadoes,

usually gild, and adorn with various flowers, and not, or whether it is not here succedaneously used as bearing the nearest resemblance to it."

Edit. American Farmer.

WEEPING WILLOW.

Extract of a letter from a correspondent, dated Wilmington, N. C. 24th July, 1822.

I observe this beautiful Tree has been attacked by a writer in the American Farmer. From a remark I met with many years ago, that "in Priestley's opinion, the Willow was the greatest absorbent and corrector of bad air," I have planted them all round that part of my rice field which is nearest my dwelling and negro settlements.

My people are very healthy, and although I
move from hence to Smithville, ten miles down the River, six weeks or two months later than my South Carolina friends do from their Rice plantations, and later than any one in the neighbourhood of Wilmington, who has a summer re-sidence—and although I visit it almost weekly A severe drought now oppresses us-Up to the through the fall, I experience no inconvenience. In my 66th year, I do not recollect having kept

selecting the interior of the plant to deposit its latter corn crops, because there are no shoots few weeks ago was unusually promising, is eggs, but also in placing them near the bottom, to fill, and the stalk itself is so dry and parched, now withering rapidly, beyond the power, I

Another extract, from Montgomery county, winter. From this circumstance taken in con- for years; never within my recollection. Such Md. states :- "That the drought still continued unusually severe in that neighbourhood, and mals with regard to their offspring, vary but little, I am induced to believe that the blades of wheat you sent for my examination have been injured by some other insect than the common Hessian Fly; and the imperfect state of their small grain around perpendicular poles, their stock also suffered very much from this the specimens, and my limited knowledge on this.

"Our corn crops are uncommonly promising, but the great quantity of cotton under cultiva-tion will make provisions scarce and dear."

COARSE SALT.

We yesterday received from Col. Wheeler, of of the ruta baga. Salina, as a sample, a small box of Salt, made at his works at Salina by the process of slow evaporation, by means of heated tubes passing through vats of sait water. This, we are told is altogether a new invention in the history of making salt, and for which Col. W. has, or is about to procure a patent from the United States. The process is a simple one, and may be described as follows:—There are two cisterns, or vats, made of plank, the upper cistern 50 feet long by 20 feet wide, the under one 50 by 25. The salt water is pumped into the upper cistern, and there brought to a salting state, so as to crystalize all the sulphate or carbonate of lime, and settle the same. The Water is then drawn into the lower cistern, where it is heated by means of fire operating on the tubes, which are of cast iron, to about 100 deg. Far. till it forms chrystals, some larger, others smaller, but all of a cubical form. One small fire warms both cisterns, by operating on the tubes. oration, by means of heated tubes passing through warms both cisterns, by operating on the tubes. The water in the upper cistern is sometimes as

THE SEASON.

We hear of one farmer in New York raising 3000 bushels of wheat this season, his acres averaging forty bushels each; and we have been told bad practice, and is the occasion of a great deal of other instances of unusual ingathering of early harvests. Throughout New England the shoes should be entirely cool. fields are loaded with excellent Indian corn; uncommonly fine crops of rye, barley, and oats, have been well housed. Potatoes, and all the other vegetable tribes, promise abundance in size almost every direction are literally breaking down with the loads of rich fruit with which they are burdened .- Boston Gaz.

THE CROPS.

We have the pleasure to state, says the Virginia Roanoke Sentinel of the 17th inst. that the crops in this section of the country, are superior to what they have been for many years: every person we meet with says, he has the largest and finest Tobacco he ever saw. Corn is already engaged at one dollar per barrel, and it is the general opinion it may be bought at any time be-fore it is cribbed at \$1 25. We have understood that one or two neighbourhoods in this county, have suffered by the drought; but even those neighbourhoods will make amply sufficient for the support of their families. We have heard that the counties of Franklin, Patrick and Henry, have been as much favoured as this. We consider the crop safe, saving hail storms, gusts, freshets, &c.

From the N. Y. Statesman.

MAMMOTH VEGETABLES.

Mr. Editor, I saw a match for your green gages the other day, in a bunch of ONIONS, and they not produced in Wethersfield, or any other part of New England. This bunch or rope contained 64 onions, red and white alternately, and weighed 23 lbs. I bought several ordinary bunch- bot county, sold his crop of Tobacco last week for

AGRICULTURE.

curacy; he told us that he would not fear to pur- have engaged an ingenious engraver to represent chase or sell extensively by this guide, which has the figure of an Ox, pointing out the particular passed through three English editions, and has places where the dimensions must be taken, in in that country gone into very general use. The order to ascertain their weight, and I flatter myauthor of the tables, gives the required weight self it will be a very useful Addition. of animals in stones, and we have converted these for the use of our subscribers, into pounds. _Editor American Farmer.

The Graziers' ready reckoner, or, a useful guide for buying and selling cattle, being a complete set of TABLES, distinctly pointing out the Weight of Black-Cattle, sheep, or swine, from forty two, to eighteen hundred and twenty, by measurement ; together with directions, shewing the particular parts where the Cattle are to be measured. By GEORGE RENTON, Ber-wickshire Farmer. The third edition. Berwick : price two shillings and sixpence, ster-

PREFACE.

Having been often solicited to publish the fol-Yowing TABLES of this READY RECKONER, I am dergone a laborious task in making out the cal-culations, which may be of use to the public.— For frequently the Buyer and Seller are at a loss even in concluding a bargain, by not being judges of the weight of the article they are treating about.

I have begun with the Calculations at three stones,* which may be as low as is necessary for those who have a swine or calf to sell: and who by no means have had such practical experience as to be judges by the eye. It may likewise be of service to those who have a beast above the common weight of cattle; they may obtain a knowledge of his value, almost to a nicety, by taking the following dimension, and considering the

value per stone, sinking offals.

Take a string, put it round the beast, standing square, just behind the shoulder blade, measure on a foot rule the feet and inches he is in circumference, this is called the girth; then with the string measure from that bone the tail which plumbs the line with the hind part of the buttock, direct the line along the back to the fore part of the shoulder blade, take the dimensions on the foot rule as before, which is length, opposite these figures stand the pounds.

The girth and length of Black Cattle, Sheep,

Calves or Swine being exactly taken, according to the directions given above, and wrought by decimals; would occasion a multiplicity of figures; which would be very troublesome in comparison of the following Tables, which will answer exactly to the fore quarters of any of the foremen-

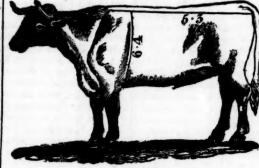

tioned cattle, sinking the offal.

To bring these useful Tables into as small a compass as possible, I have not taken notice of the half inches, which confines them to the onefourth of the figures. But to bring them to that point, when a beast measures half an inch, either in girth or length; it is only taking the difference of the leading figures. For instance, a beast measures in girth 6 feet 2½ inches, length 5 feet 4 inches, the weight of

employed by the Romans to dye the hair of the head black. If they be boiled in water, says Pliny, they are as good and wholesome to be eaten as other pot-herbs.

Sir J. E. Smith has remarked, that this tree is, as it were, a whole magazine of physic to rus-

tic practitioners.

1824

The bark, leaves, flowers and berries, are used with advantage in medicine. The leaves are said to be purgative and emetic, and are applied externally for the piles and inflammations; an ointment is made also with them as well as the flowers: the latter are used inwardly as a carminative. Infusions made from the flowers while fresh, are gentle, laxative, and aperient; when dry they are found to promote the cuticular secretion, and to be particularly serviceable in erysipelatous and eruptive disorders. Sydenham directs three handfuls of the inner bark to be boiled in a quart of milk and water, till only a pint remains, of which one half is to be taken at night and the other in the morning; and this repeated every day for those afflicted with the dropsy. Boerhaave recommends the expressed juice of the middle bark, given from a drachm to half an ounce, as the best of hydragogues when the viscera are sound.

Elder-flower water, the oil of elder, and elder syrup, are also used as medicines.

The berries are esteemed cordial, and useful in hysteric disorders; and are often put into gargarisms for sore mouths and throats.

The fungous excrescences, which are often found growing on the trunk of the elder-tree, bearing the resemblance of an ear, black in the inside and of a whitish colour on the outside. (called auriculæ Judæorum) are accounted good for inflammations and swellings of the tonsils, sore throats, and quinsies.

The wine made from elder-berries is too well known by families in the country to require any encomiums: it is the only wine the cottager can procure, and, when well made, is a most excellent and wholesome drink, taken warm before going to bed. It causes gentle perspiration, and is a mild opiate; and may be taken safely, and with advantage, by those of costive ha-

If a rich syrup be made from ripe elder-ber-ries and a few bitter almonds, when added to brandy it has all the flavour of the very best cherry-brandy.

The white elder-berries, when ripe, make wine, much resembling rich grape-wine.

The buds and the young tender shoots are greatly admired as a pickle.

The leaves of the elder-tree are often put into the subterraneous paths of moles, to drive those of Fruits, noxious little animals from the garden. Romans, who brought it from most of the countries they conquered, and had so increased the varieties in Italy, by the commencement of the Christian era, that Pliny has furnished us with a description of twenty-nine sorts that were familiar to him. He says, "figs are restorative, and the best food that can be taken by those who are brought low by long sickness, and are on the strength of young people, preserve the elderly in better health, and make them look younger, and with fewer wrinkles. They are so nutritive, as to cause corpulency and strength: for this cause," continues he, "professed wrestlers and champions were in times past fed with figs."

The ancients believed that there existed a sympathy between plants in the time of planted rue near their fig-trees, which as the time of the Eighth, either had not fruited, or planted rue near their fig-trees, which as the time of the Eighth, either had not fruited, or planted rue near their fig-trees, which as the time of the Eighth, either had not fruited, or planted rue near their fig-trees, which as the time of planted rue near their fig-trees, which as the time of the time of the sympathy between planted rue near their fig-trees, which as the time of planted rue near their fig-trees, which as the rue not familiar to him. He says, "figs are restorative, and the term of the rue not ser, who has furnished us with a list of the only grew more luxuriantly by the commencement of the rue not familiar to him. He says, "figs are restorative, and the time of the sympathy between planted rue near their fig-trees, which are stated to have been planted in the time of planted rue near their fig-trees, which are stated to have been planted in the time of planted rue near their fig-trees, which are stated to have been planted in the time of plants, and they therefore the rue may the receign reign, has not mentioned the fig-tree; the fruit."

The ancients believed that there existed a tree time of the time of the rue near their fig-trees, which are stated to have planted in the

The caprification of figs was practised by tended to by the inhahitants of the Archipelago; and it is described by Theophrastus,
Plutarch, Pliny, and other authors of antiquity.
It is too curious a circumstance in the history It is too curious a circumstance in the history to leave the world, of the fig-tree to be omitted, as it furnishes a selves in his garden. convincing proof of the reality of the sexes of plants. The flowers of the fig-tree are situated within the pulpy receptacle, which we call the fruit. Of these receptacles, in the wild fig-tree, some have male flowers only, and others have male and female.

In the cultivated fig, these are found to contain only female flowers, that are fecundated by means of a kind of gnat bred in the fruit of the wild fig-trees, which pierces that of the cultivated, in order to deposit its eggs within; at the same time diffusing within the receptacle litans, the result of their manners and governthe farina of the male flowers; without this ment, it follows that agriculture must be almost operation, the fruit may ripen, but no effective the only art which they cultivate. Without vasceds are produced. Hence it is that we can nity or ambition, they have no idea of parade,

NAPLES-ASPECT, SOIL, &c.

"From the national disposition of the Neapo raise no fig-trees from the fruit of our gardens, having no wild figs to assist the seed. They are consequently raised by cuttings, or by layers.

In many parts of the Grecian Islands, the inhabitants pay such attention to the caprification of luxury, and most of those of the first necesses the cultivated figs that they attend daily for sity are supplied by strangers, who carry back

twelve times the quantity: thus one of the most minute insects is, by the attention of man, made a principal cultivator of fruit.

It is a curious fact, that fresh-killed venison, or any other animal food, being hung up in a figure for a single night, will become as tender, and as ready for dressing, as if kept for many days or weeks in the common manner. A gendays or weeks in the common manner of the most of the labourer, and the common manner. A gendays or weeks in the common manner of the most of the cattle. The variety of vegetables, skilfully intermixed theman, who lately made the experiment, assured me that a haunch of venison which had or purple clover, which is indigenous in the soil with little manure; but, at the same time,

The greatest part of the kingdom is mountainous;—some of the highest preserve the win-In the neighbourhood of Argenteuil, near Pa-ter snows on their summits during the whole to an enormous size; and on the lower slopes of

Round the villages they have fig-trees growing in the rubbish, lemon trees in the gardens, and fruit trees round the enclosures. We see

In the neighbourhood of Naples the fields are often covered with elms, the branches supporting For medical purposes, figs are chiefly used the vines hanging in festoons between them; and melons. The country women here are not at The wood of the fig-tree is of a spongy tex- all handsome; their physiognomy is harsh, and

These farmers gather with care not only the six months the children go every morning and cut with a sickle a load of the clover for the cows. They have goats also, and sometimes an ass or little horse for going to town and carrying burdens; but this is an advantage belonging only to the better sort.

In the following spring, Indian corn is planted on the stubble of the clover or beans. The land is then manured, and on this crop depends the food of the family. The Indian corn is hardly reaped when the ground is turned up for corn again; but after this second harvest, they only cultivate different kinds of vegetables.

From these details it appears that there is a regular rotation of crops in the ashy soil round Vesuvius, which is regulated nearly in the following way:

First year, Indian corn manured. Second do. Corn.

Third do. Onions and vegetables. Fourth do. Corn, followed by beans or red

clover. Fifth do. Melons.

5 years-6 crops.-That is to say, this rotation affords six crops in five years, of which hood, has established an eternal source of ferti-

five acres. These families certainly live very soberly and consume more vegetables and fruits than corn; but, in fine, they live. Such an init amounts to 5,000 souls in a square mile, in the

Beyond Pompeia we see no longer any traces of the disorder caused by Mount Vesuvius. The coast extends in almost innumerable slopes, on which grow together olives and mulberries, vines and oranges. This favoured tract occu-pied all the space between Sorrento and Salerno, and is distinguished by the name of Piave di Sorrento. The plain of Sorrento is almost the only part of the kingdom of Naples in which one can discern the action of an active and enlightened industry. It is in this fine region also that the farmers have attempted, with great success, the cultivation of cotton; insomuch that, in the year 1812, they supplied the manu-

the cultivation of cotton, it became necessary

The farmers not being able to subsist without the different crops established by the ancibegin their system of rotation by the Indian corn, for which they manure the ground. Corn cucceeds, and then beans are sowed immediately after harvest. This plant being destined only for feeding the cattle during winter, is consumed early, and the soil can thus be prepared by the end of March, without any impediment, for receiving the cotton seed .- After it is gathered, corn is sown again in the same autumn, to which immediately succeeds the red clover.-After the clover comes melons; and when they are ripe, vegetables occupy the ground till spring, and terminate the rotation of which this is the formula:

First year, Indian corn manured. Second do. Corn, followed by beans. Third do. Cotton.

Fourth do. Corn, followed by clover. Fifth do. Melons, followed by vegetables.

8 crops. 5 years.

d

This course therefore supplies eight crops in

Editorial Correspondence.

Extract of a letter to the Editor .4m. Farmer, dated Edenton, N. C. 16th August.

"Our corn crops are very much injured by the drought.—It is generally believed that there will not be half crops raised in this and the two adjacent counties."

SUBSTRATUM PLOUGHING.

Extract of a letter to the Editor of the American Farmer, dated BROOK GROVE, Montgomery Co. Md. 8th mo. 30th, 1822.

Our crops in this neighbourhood are likely to be very short, particularly roots of every des-cription. We have not had rain since planting our summer crops sufficient even to wet the ground plough deep.—We however find a stri-king difference wherever the substratum plough has been used, as the corn in every instance retains a tolerable colour, and in some instan-ces will yield at least double what the land adjoining, of equal quality, where the common plough only has been used. I can confidently recommend the plan of stirring the sub-soil, and hope that thee will not fail to avail thyself of its great advantages.

In haste, thy friend, ROGER BROOKE.

JOHN S. SKINNER.

ERRATA.

dropt boyish amusements, and thenceforth was for the purpose of tarts.

GOOSEBERRY.—GROSSULARIA.

Holland into Kent."

The gooseberry, which is now so much and as during their reigns, most of our best fruits so justly esteemed, is a native of Europe; and as during their reigns, most of our best fruits and vegetables were first introduced and culti-berts growing at the present time, than in all England besides, there being several hundred acres land besides, there being several hundred acres planted with filbert-trees in the vicinity of that it indigenous to this country, although Drs. The London market is entirely supplied Smith and Miller both entertained doubts of its ford to send to Holland for a lettuce.

The gooseberry which is now so much and as during their reigns, most of our best fruits and vegetables were first introduced and cultivated in this kingdom; but even during the reign of these sovereigns, gooseberry leaves northern counties, in the wild state, I consider ford to send to Holland for a lettuce.

The gooseberry is but little esteemed on the from thence with these puts, which are excellance truly so. It appears not to have been continent, for want of heing more known; and Filberts are not only much more agreeable than the common nuts, but are esteemed wholesome and nourishing when taken with moderation. The cream of these nuts is good for the stone and heat of urine. Emulsions may also be made of them. The Romans used them with called feaberry-bush, in Cheshire, my native on foreign mountains may the sun refine vinegar and wormwood seed for the yellow in Lancashire and Vorkshire. In Norfolk it was in Lancashire and Yorkshire. In Norfolk it was Filberts are not found to answer well but on abbreviated into feubes. It appears to have tavery few soils: they seem to like a stony, san-ken the name of gooseberry, from its being We envy not the warmer clime, that lies

It has been a question agitated among physical class, they are not suffered to grow above five dance. The fruit is used in divers sawces for six feet high, and are kept with a short stem, like a gooseberry-bush, and very thin of wood, somewhat in the shape of a punch-bowl. The truit is greatly profitable as are troubled with a bot burning these trees. It has been a question agitated among physical class, whether fruits be safer before or after meals. The answer to this seems to depend on a knowledge of the stomach. In a weak stom-wood, somewhat in the shape of a punch-bowl pleasant to the taste, but it is greatly profitable ach, they are more apt to be noxious when emp-

they have discharged their pollen, to the bene-multiplied in it's variety, and brought to it's fit of the future fruit.

The gooseberry bush is propagated by cuttings or suckers; but the former way is preferable, ed quite ripe, and laid for some days on the one of our most valuable fruits, being so easily pro-Straight shoots should be selected about eight floor of a room, where the sun can get in, to dry pagated and so regular in it's production, furnishing inches long, and planted about half the length, them effectually.

The best time for The Byzantium nut, although much esteemed some and agreeable diet. It is the earliest as well planting them is in the autumn, just before the some of the best fruits for spring tarts; and, when leaves begin to fall. It is desirable to sow the in this country, and very rarely seen in our ripe, the gooseberry is regarded by all classes seeds of ripe gooseberries, as by this means markets. This mut was brought from Constan-

tinople, before Constantine had given his name July to November, by those who have well-reguthe that city; and I am much inclined to think, lated varieties, as some kinds ripen early, while that the Greeks procured it from more eastern others are not only later, but have the quality countries. They were first cultivated in this country by Mr. John Ray, in 1665, and are generally called Cobnuts.

They were first cultivated in this of hanging on the bushes until near Christmas: among the last, the Warrington gooseberry is considered the best. I have not attempted to nerally called Cobnuts.

Pliny informs us, that Vitellius brought the give even the names of all the varieties of this little before fruit, finding them so numerous, that one nursenuts, called fistichs, into Italy, a little before fruit, finding them so numerous, that one nurse-the death of Tiberius, and that Flaccus Pompe-ryman furnished me with his list, and obliged ius, who served in the wars with Vitellius, car-ried them into Spain. Nuts are now grown in which in weight was equal to three guineas and

The pale gooseberry was first brought from Flanders in the year that Henry the Eighth received the title of Defender of the Faith. This "gardening was first brought into England, for profit, seventy years ago," in the reign of Queen Elizabeth, He adds, "gardening crept out of Pentandria Monogynia.

GOOSEBERRY.—GROSSULARIA. ceived the title of Defender of the Faith. This monarch, and his daughter Queen Elizabeth, seem to have encouraged the art of gardening,

from thence with these nuts, which are excel-lent in quality, and, if quite ripe, will keep known to the ancients, either in Greece or Rome, for eigners seem astonished at the size and flavour known to the ancients, either in Greece or Rome, foreigners seem astonished at the size and flavour as their authors have made no mention of it; of this fruit in England. It cannot be propa-Filberts are not only much more agreeable but it is noticed by the earliest naturalists who gated with success in the warmer parts of the

in botany, it will be observed, that the male and female flowers grow quite distinct. The male flower is a scaly catkin, resembling the bullion in fringe; it appears in autumn, and waits for the expansion of the female blossom in the spring, from whence the nut arises: this is very diminutive, but of a fine crimson colour; therefore the pruner should make himself acquainted with the wood that produces each blossom, and not destroy too many of the male flowers that will fall from the tree fore.

The destant to the taste, but it is greatly profitable to such a sare troubled with a hot burning ach, they are more apt to be noxious when empty, than when distended with animal food. Here likewise they cannot be taken in such quantity as to hurt. In strong stomachs there is little difference; there they would seem to promote appetite. In weak stomachs even when or flesh of divers sorts." Green gooseberries have continued to be used as a sauce for mackerely lour; therefore the pruner should make himself acquainted with the wood that produces each blossom, and not destroy too many of the male flowers that will fall from the tree fore.

The gooseberry, which was but a small here.

glish and Dutch gardeners; and it is now deemed as the roots are less likely to shoot out suckers.

either by cuttings or suckers.

In pruning these bushes, observe to keep the stem quite free from shoots, at least that from ten or twelve inches from the ground, there be but one regular stem. I have seen them train- and sweet." ed on trellis work, where the fruit has grown and ripened well; and it is a most desirable method for small gardens, as they have a neat appearpace, take but little room, and form a good back ground to flower-borders.

GOURD.-CUCURBITA.

In Botany, of the Monacia Syngenesia Class. Natural Order, Cucurbitacea.

The plants of this genus are very nearly allied to those of cucumis, and of them there is a

great variety.

Gourds were more esteemed by the ancients, than either melons or cucumbers. Pliny has it is good fried with butter; when half-grown, minutely described them as different from the it is said to be excellent, either plainly boiled, pompion or cucumber. He says, "they are ful than the former fruit. When properly dress-ed," he says, "they are a light, mild, and wholesome food. The young and tender stalks," he states, "were dressed and served up to table as a good dish; and the fruit of those that climbed up trees, or walls, or on the those that climbed up trees, or walls, or on the to the pompion. frames of arbours, were better food than those which crept on the ground. They have of late," says this author, "been much used for pots and pitchers;" but long before, they had been used as barrels to keep wine in. Both the wild and the garden-gourd was much used in medicine by the Romans, who also employed the seeds as a charm to cure the ague. (Pliny, l. xx. c. 3.)

Gerard says, "the pulp, or meat of the gourd, used as a poultice, mitigates all hot swellings,

mation of the eyes."

bottles, holding from one pint to many gallons. which extends south as far as Cortona, and west Barham speaks of one that held nine gallons; to Pisa. Near the sea, this hollow, which is frewhich they pour hot water, in order to dissolve church. EXTRACTS AND REMARKS

On Italian Agriculture, communicated for the American Farmer, by S. Hambleton, Esq. U. S. Navy.

Continued from page 163.

and takes away the head-ache and the inflam- SOIL AND AGRICULTURE OF TUSCANY

The bottle-gourd, (Lagenaria,) grows in Tuscany comprises three regions entirely dismany parts of the world to near six feet long, tinct. The Arno flowing through its smiling valand two feet thick. The rinds or shells are ley, forms in the midst of the mountains a holused by the negroes in the West-India ialands as low of which Florence occupies the centre, and ing manner:-they make a hole at one end, into the sea, and to the frontiers of the states of the stick, and the inside rinsed with sand and wa- air generally unwholesome; with eminences

sixths occupy the regions known by the name of used instead of the common coloquintida." Sloane and Barham describe a sweet gourd, which, the latter says, "grow two or three feet long, as big as a man's thigh, is full of sweet pulp that makes a pleasant sort of sweetmeat or preserve." He says, "the distilled water is good in fevers, and the pulp applied to the eyes abates their inflammation." Sloane says "the seeds are diuretic, and made into emulsions, temper and take off the acrimony of Lunan describes the squash (melopeps,) a small gourd, not exceeding the size of a mode-

bushes generally grow in a better shape than rate fist, and which, he says, "when young and of the Isle of Elba. The course of the Arno either by cuttings or suckers.

Properly boiled and dressed with butter and above Florence, traverses the Val de Chiana; this black pepper, is a delicious vegetable." Louri-valley resembles in every respect the Val d'Arno ero save "this fruit is of great use in long voy-which extends from Florence to the sea. It will be sufficient therefore to describe the latter, in order to make the reader acquainted with the whole valley watered by that river.

In following the road to Pistoia and Lucca, as far as Pisa, we continue on the right bank of the tains and their foliage conceals an infinite number of little farm houses, which people all the base of these mountains. On the upper slope with the pale tint of the olive, and forms a noble crown to this magnificent amphitheatre.

The road is bordered on each side by cottages scarce a hundred steps from each other; though They consist only of a single pavilion, which has frequently only one door, and two windows, in front. These houses are always placed at some distance from the road, and are separated from it by a wall, breast-high, and a terrace a few feet in breadth. On the wall are commonly vases of antique form, from which raise aloes, flowers, or young orange trees. The house itself is entirely covered with vines, and in front, are swarms of young girls, dressed in white linen, with silk corsets, and straw hats, ornamented with flowers, and put sideways on their heads.

They are incessantly occupied in preparing the fine straw which is the treasure of this valley, and of which the Leghorn hats are made.

This manufacture is the source of the prosperity of the Val d'Arno; it brings three millions of livres* annually, which are divided solely among the women of this country, for the men do not meddle with this work in the least. Each girl purchases for a few sous the straw that she wants; tries to plait it as fine as possible, and sells the hats she makes herself and for her own profit; which in length of time forms her marriage portion. The father of a family has a right however to exact from the women of his house a certain quantity of work in his farm, which is performed by women from the mountains who are paid by and the Rev. Mr. Griffith Hughes mentions quently very narrow, opens into a vast smooth the girls of the plain from the produce of their them, in his History of Barbadoes, as holding plain, that has been left by the waters. The thats, to do the work in their place. In fact they twenty-two gallons. The shells are cleared of right bank of the Arno, is bordered by the high gain thirty or forty sous a day, by plaiting their the pulp and seeds by the negroes in the follow- chain of the Apenines; the left bank extends to straw, while they can get a poor work-woman from the Appenines for eight or ten. They also assert that any rough labour would harden their the pulp, which afterwards is extracted with a face, the soil of which has little fertility, and the fingers, and deprive them of the agility necessary for the fineness of their work.

These are the peasant girls of the Val d'Arno so The Appenine region comprises the two sixths much celebrated by travellers for their beauty, and will contain water or other liquids for a of the whole extents of Tuscany; the rich val- and whom Alfieri used to go and visit to study ley of the Arno only one sixth; the three other their language; they may truly be called Arcadian shepherdesses, for in fact they are not peasants, as the human body. Brown says, "the decoc-the Maremma, which we have already described; being never exposed to heat, toil or fatigue, and consequently always preserve their native charms.

> It is said that two acres of ground are sufficient to one sixth of its extent. We have already ex- to supply all the straw used for the manufacture hibited to the traveller a sketch of the character of hats in Tuscany. This straw is procured from

ments by small canals and rows of trees. These are sometimes mulberry, but almost always poplar, the leaves of which serve as food for animals. Each being a vine-plant, the branches of which are twisted by the farmer in a thousand different country, well watered, fertile and covered with comes from Parma, and is a great luxury, only directions.

These compartments, arranged in long squares, are spacious enough to be ploughed with a plough without wheels, and two oxen --- ten or twelve farmers have a pair of these animals among them, and they employ them successively to plough all the farms. These oxen come from the Rowan with a great deal of embroidery, and red fringe, veying young women adorned with flowers and are not proprietors .- P. 580, &c. &c. ribands.

The farmers of the Val d'Arno have not forage enough to keep cows; and therefore they only rear heifers, which they buy at three months old, and keep till they are eighteen, when they sell them to the butchers, and replace them with younger ones. The drivers bring these heifers to the fairs of the Val d'Arno from the pastures of the Maremmas.

This custom arises from the rotation of crops adopted in these vallies. There being no natural meadow, the leaves of hay, the remains of vegetables, and a little clover is the only food not irrevocably fixed, but is most commonly as follows:-

First year, Indian corn, haricos, Peas or other legumes, manured.

Second do. the same; corn. Third do. winter beans. Fourth do. same; corn.

Fifth do. same; clover, sown after the corn, cut in the spring and followed by sorgo. That is to say, six crops in five years of which

only one is for cattle.

The sorgo is a sort of large parsnip, which affords a coarse flower of which a bad soup and polenta* are made.

These different crops, though only once manued in five years, are nevertheless very fine. This is to be attributed to the nature of the soil, which is alluvial, deep and fertile; to its being cultivated with the most minute care; to the crops being happily interculated with each other, and finally to the extreme vicinity of the habitations; which furnish them that chemical manure, the action of which escapes our senses, but which expopulation lives on the produce of this soil so subdivided; but they live with severe economy, and straw hats. But neither the natural fertility of form a great part of the food of the inhabitants. this soil, nor its abundant productions constitute

NOTE BY A FRIEND-* A sort of food made on the Appenines, of the meal of chesnuts, and in the plains, of the meal of Indian corn, simply boiled in water, when cool, cut in slices and recooked with the gravy of stewed meat and grated cheese. APPENDIX

To the paper drawn by Sir John Sinclair, on the USES OF SALT FOR AGRICULTURAL PURPOSES; stating the Experiments, which are best calculated to ascertain the advantages of using Salt, for objects connected with Agri-

If an Experimental Farm had been fortunately established, under the sanction of public authority, and at the public expense, some years ago, when it was suggested, every use to which Salt is applicable in Agriculture, would, most probably, have been ascertained before this time; and Parliament would have had decisive evidence, on which to have proceeded in its recent inquiries. As it is, nothing remains to be done, but to recommend a number of experiments, to those who may be inclined to direct their attention to so important an object, to be tried as circumstances are favourable to the attempt. In this way, much may be effected, provided the experiments are conducted with accuracy, and reported to the Board of Agriculture, for the purpose of comparison and publicity.

1. Experiments on Fallows. To sow in Autumn, from 30 to 40 bushels of foul Salt, or from 20 to 30 bushels of pure Salt, per acre, on strong soil proposed to be fallowed. in spring; and The land to be ploughed before winter, and fre-not so treated. quently stirred in spring and summer, so that the Salt may be thoroughly incorporated with the Salt may be thoroughly incorporated with the soil, before the seed is sown. In the course of this experiment, the following particulars to be ascertained: 1. Whether the Salt destroys weeds and insects;—2. Whether it makes the soil more friable, and less tough or adhesive;—3. Whether it produces an abundant crop of barley, or of wheat, free from rust or blight;—and, 4. What are the effects on the succeeding crop of clover, and the crops that follow it.

To make a compost of fine earth, with Salt, in the proportion of five, ten, or fifteen bushels per statute acre, (the preferable quantity not being yet ascertained,) and to strew it on the first crop of clover, in the months of March or April, or on the second crop, immediately after the first crop is cut, and to compare the effect of this compost, with parts of the same field, not treated in the proportion of five, ten, or fifteen bushels per statute acre, (the preferable quantity not being yet ascertained,) and to strew it on the first crop of clover, in the months of March or April, or on the second crop, immediately after the first crop is cut, and to compare the effect of this compost, with parts of the same field, not treated in the proportion of five, ten, or fifteen bushels per statute acre, (the preferable quantity not being of clover, in the months of March or April, or on the second crop, immediately after the first crop is cut, and to compare the effect of this compost, with parts of the same field, not treated in the proportion of five, ten, or fifteen bushels per statute acre, (the preferable quantity not being of which they are found to fatten in half the period they would otherwise require.—Observations by John Marshall, Esq. on the Medical, as well as Dieteit Properties of common Salt, in the London Medical and Physical Journal, vol. xxxix. No. 231.

† Some important information is given, of the great advantage derived from giving Salt to sheep, and the crops that follow it.

It would be very important, to compare the land thus treated, with an equal quantity of the same field, manured with lime, stating the ex-

washed into the soil by rain, for the purpose of it, greedily, when salted. ascertaing the following particulars:—1. What are its effects upon the different crops on which the Salt is tried ;-2. Whether it answers best on strong, or light soils;—3. Whether it de-stroys the wire-worm, grubs, the turnip fly, or -4. Whether it prevents scabbiness on potaafter crops.

A similar experiment may be tried, sowing the Salt about a fortnight before the seed, and mixing it with the soil by harrowing it in.

* It to to be observed, that Salt, at the works, costs only sixpence her bushel, weighing 56lb.— and for sixpence, that it may be conveyed to any hart of the United Kingdom. But the tax formerly amounted to 3000 per cent. of the prime cost.—See the letter by William Horne, Esq. of Liverpool, on the Repeat of the Duty on Salt, printed anno 1816, p. 6.

3. Experiment for the Improvement of Waste Lands.

To collect heath clods, and other refuse, when waste lands are first cultivated, and instead of burning them, to mix them with layers of Salt, so as to convert them into manure, and to try the effects of that manure with a crop of turnips or potatoes.

Experiment with Salt, as a Remedy against the Smut.

To ascertain, by comparison, whether immers ing seed wheat in water, so impregnated with Salt, that an egg, will float in it, is not an effectual remedy against the smut, provided the seed be frequently stirred in the water, and the light grains skimmed off, and the seed afterwards dried, by having new slaked lime sifted upon it.

5. Experiments for ascertaing the Effects of sowing Seed with Salt.

To sow various sorts of seed,—in particular may have access to lick them.‡ those of an oily quality, with different proportions of Salt, varying from equal quantities of Salt and seed, to one sixteenth of Salt, in order to try the effects resulting therefrom, whether in regard to improving the crop, or preserving the seed from the attacks of vermin in the ground.

6. Experiments on Grass Lands.

To try the effects of strewing, in autumn, six teen bushels of foul Salt, or from 10 to 12 bushels of pure Salt peracre, on coarse herbage, or on peaty soils, also on grass lands covered with moss in spring; and to compare the effects with lands

7. Experiments on Crops of Clover.

8. Experiments for ascertaining the Effects of Salting Hay.

To mix Salt, at the rate of from 25 to 35 pounds pense of each, and their relative produce; and weight of pure Salt, per ton of hay, when in the al Academy of Sciences at Paris, where there is a what would have been the expense, had the Salt been exempted from duty.*

weight of pure Salt, per ton of hay, when in the al Academy of Sciences at Paris, where there is a cat of putting it together, particularly with the haper entitled "Physical Observations on the efsecond crop of clover, in wet or damp seasons, in fect of Salt in Fattening Cattle," 2. Experiments on Crops of Grain and Roots.
To sow, on various crops, as wheat, barley, oats, beans, pease, potatoes, and turnips, as soon as ceptable to stock, than hay not salted. Also to the seed is covered with the earth, 16 bushels of foul Salt per statute acre, of from 10 to 12 bushels of soll salt per statute acre, of from 10 to 12 bushels of the seed is covered with the earth, 16 bushels of soll salt per statute acre, of from 10 to 12 bushels of soll salt per s els of pure Salt, on the surface, leaving it to be sed by them in its original state, they do not eat in that moist climate. The effect was horrible:

9. Experiments to try the Effects of Salting

the beetle, and other vermin destructive to crops; to horses or cattle, in order to ascertain, wheth--4. Whether it prevents scabbiness on pota-toes; -5. Whether salted turnips are less injured by the fly; -and, 6. What are its effects on the jurious.

10. Experiments with Stock.

following proportions:
1. To horses per day, from three to four oun-

2. To cows and breeding heifers per day, from three to four ounces. 3. To working oxen from three to four ounces

4. To young cattle, from two to three ounces.

5. To calves, one ounce.

6. To sheep, at the rate of two ounces of Sal per week, divided into three portions.

7. To hogs in small quantities, occasionally mixed with their food.

By some it is said that poultry do not thrive with Salt, though it is well known, that pigeons relish it much.

These experiments are recommended, for the purpose of ascertaining, by comparison with animals receiving no Salt, whether they thrive better, with the addition of Salt to their food ;whether they thrive better on coarse fare ;whether it improves the flavour of milk from cows fed with turnips ;-whether stock in general become tamer and more domesticated ;-and whether they are more free from disease, -as the bots in horses, and the rot, the sickness, or the scab

in sheept.
The Salt to be given to stock, to be either powdered and mixed with their food, or in that state put on stones, slates, or coarse cloths for them to lick,-or in large lumps so placed that the stock

. Experiments to ascertain whether Salt wil. prevent the Rust, or Blight in Wheat.

To mix with the soil a fortnight before the wheat is sown, from 30 to 40 bushels of foul Salt, or from 20 to 30 bushels of pure Salt, for the purpose of ascertaining its effects on the succeeding crop of wheat; and in particular, whether it prevents the rust or blight. Also to ascertain, whether a crop of wheat, sown after turnips, raised with Salt mixed in the manure, is exempted from the rust.

- * It is said that in Ireland, when fattening their hogs, shey sprinkle a little Salt with every meal,
- in considerable quantities, in the district of Craut near Arles, in France.—See Annals of Agricul-ture, vol. xxiv. and Horne's letter on the Salt duties, p. 11; also vol. i, of the Memoirs of the Roy-
- as the severest funishment that could be inflicted these wretched criminals are said to have been devoured by worms, engendered in their own sto-machs. The lower orders of people in the inland no sprinkle straw with brine, also to mix Salt that so f Cornwall, suffer the greatest distress from the same cause, being obliged to eat their potatoes to horses, or clover cut later than usual, and given to horses or cattle, in order to ascertain and the same cause, and their children and their children and their children and the same cause. -A lady, who had a great antipathy to Salt, and had never taken any, nor even salted meat, was infested by worms from her earliest infancy, during her whole life. This proves the advantage to be derived from Salt to every animal liable to To try the effect of giving Salt to stock in the that disorder, and the reason why children are more aft to be troubled with worms, than grown up persons, is this, their taking less Salt with their food, and frequently none. This is a point, that ought to be particularly attended to at schools, and public seminaries, where great numbers of young people are collected. Where Salt cannot be had at a price within reach of the poor, salted meat, or fish, herrings in particular, should be recommended to them, more especially if they lived much on potatoes.

Salt may be of use in this respect. It is so great an enemy to corruption, or putridity, that the wood employed in Salt mines, to support the roof or sides of the mine, or the beams of wood in Salt warehouses, remain undecayed for ages.* It is natural, therefore, to suppose, that salt, judicious ly applied, will likewise prevent the injury which plants receive from the fungus tribe, to which the disease called rust, is attributed.

12. Experiments for Improving the Quality of Dung by mixing it with Salt.

To ascertain, by comparative experiments, whether strewing Salt over dung, improves its quality, and the crops it produces, and what quantity is most beneficial.

13. Experiments for converting the Roots and Stems of Vegetables into manure.

To collect the roots and stems of weeds growsee what proportion of Salt it would require to the intervals between the may be dissolved when ploughed in, acts as a very excellent maconvert the whole into a substance, capable or before the fibres of the roots meet it. furnishing food for plants.

14. Experiments for converting Peat into a Manure by means of Salt.

Salt is necessary, to convert peat into a manure for turnips and other crops.

15. Experiments with Composts of Earth.

20 bushels per acre, and to ascertain the difference in point of expense,-in regard to the appa--and on the ensuing and succeeding crops.

16. Experiments to ascertain whether the Weight of Butter or Cheese is augmented, by the Salt used in manufacturing either of these Articles: and whether the Farmer is indemified by the additional Weight, for the expense of the Salt.

It is said, that a farmer in Cheshire, (Mr. Weaver) who had mixed a pound of Salt with ten lent manure for onions .- If the Salt is sown after pounds of butter, found, that after working it in the crop appears above ground, it is destroyed. It is destroyed. Hay thus treated (and clover hay particularly) 10 lb. 1 ounce; whereas, that ten pound of the h. 28. butter, unsalted, had continued of the same weight. Mr. Weaver likewise asserts, that having rubbed in three pound of salt, into a cheese of 46 lb. weight, it was reduced, in six days to 43 lb.; A proof that salt decreases the weight of cheese. ed by Messrs. Careys' of Philadelphia.

CONCLUSION.

On the whole, it is hoped, that every public spirited farmer, will try some of these experi-ments, according as his situation and other circumstances will admit of them: for the purpose of proving, that the attention which Parliament has bestowed, on this occasion, to the interest of the farmer, has not been misapplied.

On the Uses of Salt, in Gardens.

This is a subject well entitled to the attention of the Horticultural Societies of Lendon and Edinburgh. In this place, it is only necessary to

NOTE.

The utility of Salt for various agricultural purposes has long been known, and attended to in the United States.

bandry, printed in Boston between 1745 and 1754: tons in two stacks were thus perfectly cured, and and Mr. Cadwalader Ford, in a paper on this subject addressed to the Massachusetts Agricultural Society, and published by that body*, bears testimony of its highly fertilizing effects on flax. The proportion which he advises to be used, is double observe, that several respectable individuals, have the quantity of Salt to that of seed. He strewed ascertained the importance of Salt as a manure the Salt at the time of sowing the seed. From observe, that several respectations are respectations as a manure ascertained the importance of Salt as a manure the Salt at the time of sowing the seed. From by juage revers, in Plant. I make some juage revers

The publication of Mr. Ford's paper by Mr.

There is reason, from analogy, to hope, that other fruits produced on the borders of the Rhone, Carey, caused the experiment to be repeated by Mr. Henry Hendrickson, of Cecil county, Maryalt may be of use in this respect. It is so great are improved by the same application.*

Mr. Henry Hendrickson, of Cecil county, Maryalt may be of use in this respect. Mr. Holinshead suggests, that every thing that sowed one peck of flax seed, and one peck of Salt together, and that when the flax was about three face of the ground around it, immediately and seed is covered with the earth.† The advantage derived from the application of Dutch ashes, so full of saline particles, to gardens in the Nether-duced more seed than the flax on the rich land."

He also sowed a piece of excellent land with flax, and although he had a good crop, yet the flax on the poor land "was a great deal better, and produced more seed than the flax on the rich land." A farmer in Delaware county, to whom I men-

roots: that the Salt might have time to be dissolved before the fibrous roots should reach it." Drilled carrots also grow well in a salted bed, Upon onions and turnips it had no effect. The

To make a compost of peat and Salt, mixing it Holmes Chapel, who lived near the Salt Works, are constantly in the practice of giving a portion occasionally, to ascertain, what proportion of gave a favourite old mare, who was much broken the appetite is not attle weekly. They find that winded, some spoilt hay, that had been salted, (at the appetite is not only thereby greatly promottat time, Salt for agricultural purposes, was ed, their digestion strengthened, and of course free of duty). The mare had nothing else to their disposition to fatting increased; but that subsist on, but throve on that food so well, that she was fit to be put to work again next spring. This late war with England, when the prices offered To make a compost, with the usual quantity of lime, and another with Salt, at the rate of 15 or induced Mr. Bracebridge to drench some rotten for domestic manufactures rendered the multiplication of Merino and other sheep an object with sheep, night and morning, with strong brine, cation of Merino and other sheep an object with after which, he did not lose one;—they became the American farmers, they were in the habit of rent effect of the lime and the Salt, on the earth, fat, and the meat was as fine and good, as if the placing large lumps of hard Rock-Salt in various parts of pasture fields, for the sheep to lick at pleasure. It is rational to believe that the very marked superiority in the health of every species of American cattle over those of Europe, may be ascribed to the general and free use of Salt. Many † Hints on Salt, as a Manure, by Hollinshead, give a portion of Salt daily to their horses, as a preservative against worms of all kinds, as well as to preserve their digestive powers.

3. The practice of salting hay has been generally adopted for 30 years or more in Pennsylvanias. may be put up with much less drying than when-Salt is not used. Many farmers are in the excel-lent practice of mixing straw with hay, (as re-gularly as the hurry of stowing away will admit,) As a supplement to the foregoing, we add the layer by lowing note by Dr. Mease, annexed to the edifodder is moreover increased by this mixture of. hay and straw. About one peck of Salt to the ton of hay is enough, but more will not be injurious.

4. Salt will even preserve fresh clover from rotting, although put up in stacks in time of rain. An extensive and bold experiment was made in this way by Mr. Luke Morris of Philadelphia, at 1. As a manure it was early used for flax, as his farm in Gloucester county, New Jersey, in appears from some of Elliott's essays on hus-the rainy summer of 1804. About twenty-two

LETTERS FROM PARIS.

[The following letter contain so many curious facts in natural instory, &c. that we beg to request attention to its compressed intelligence .-LITERARY GAZETTE.]

PARIS, April, 1822.

The annual public sitting of the Royal Academy of Sciences was lately held under the presi-dency of M. Gay Lussac. This meeting was not, perhaps, so remarkable as those of former years. The public of Paris must be amused, and it is difficult to avoid producing ennui in discoursing on natural philosophy and astronomy. Thus the Academy always experiences some embarrassment in selecting, from the lectures which have been delivered at the private meetings in the electromagnetic experiments made within the this we know that the colour is not so bright, or so permanent, as when indigo is fermented by some vegetable basis, containing in itself the primitive colouring matter, we shall be much primitive colouring matter, we shall be much ges, mentions, "the indigo plant as growing wild be made to M. Oersted's discovery. M. of the Academy, read a long notice on the sub ed without difficulty, and that it would soon be lost sight of. This is, I believe, the 25th comet which Pous the astronomer has been the first to beautiful than that which is extracted from the duce a sufficient quantity to powder, and mix it same plant in other parts, that many have been with ley as before mentioned. led to doubt whether the African cloths brought into this country (England) were dyed with indigo or not. They apprehended that the colours in these, which became more beautiful leave the stalk and branches for some days in wall countries.

A report of the proceedings of the Academy since last year, was delivered at the same meeting. The Academy of Sciences is, of all those which compose the Royal Institute, most numer ous and active; and its reports always contain the results of many interesting transactions. following are some curious facts of genera! interest, selected from the report of the present year. M. Du Trochet observing that the stems of plants The indigo made from the wild plant, is said to always grow in the direction in which the seeds shoot, he placed some seed in holes bored at the pended it to the ceiling of a room, thinking by this The leaves should be gathered when the plant means to force the stems of the young roots to

lar facts, M. Du Trochet concludes that vegetation is governed by an internal principle, and not been so attentively observed, we ought certainly carbon and hydrogen; so in this respect at least northern bounds of Canada to the southern little animals, particularly when we consider the acorns! number of works which have been written on this subject. The Abbe de la Rocca who lived long in the Archipelago, has written, in French, three large volumes on the natural history of bees. The subject, indeed, seems to be inexhausbees. The subject, indeed, seems to be inexhaus-tible. A Swiss family, named Huber, have un-sing Agriculturist. He is always seeking im-dertaken to maintain permanent observations on provement in what is most useful to his fellowdertaken to maintain permanent observations on sing Agriculturist. He is always seeking imbees, and to compose a new natural history of those animals. Though the head of this family be blind, he seems to have perceived many things which have escaped the notice of his predecessors. The Hubers have been for these twenty or 1820, two pairs of the largest kind of Geese, suplements in what is most useful to his fellowsmall; from a third to one half of the designated five miles being covered by the tributary wasters of the Choptank. It should also be stated, that the persons recorded were the venerable heads of families.—The same district embraced to be the largest in the world, weighing both the same time a number of the same time a number o sors. The Hubers have been for these twenty or posed to be the largest in the world, weighing at the same time a number of as aged and hale on bees, and it is probable that they will in due on bees, and it is probable that they will in due served, some weigh 30 pounds. At first he was thinly populated tract of similar size in the Unitime succeed in discovering all the secrets of the time succeed in discovering all the secrets of the hive. This family lately communicated to the Academy a work in which they attempt to overthrow the common opinion, that it is the pollen ooth geese reared but one to maturity. That both geese reared but one to maturity. That hale and hearty, on the 27th day of March, 1808, of flowers which furnishes bees with materials and the two old pairs each brought up a litter that country populated tract of similar size in the Unitation of the Unitation o for wax; they have observed that bees produce and the two old pairs each brought up a litter; wax only when they have extracted the honey or he has now 17 young and 5 old ones, all perfectly nectar of flowers; if bees gather the pollen it is merely for the nourishment of the larvæ; for this purpose they mix it with a little honey. The wax, when made, appears in little scales, which detach themselves from between the rings of the abdomen, where M. Latreille, the great dissector of insects, has discovered the receptacles of the wax, placed opposite the second stomach of the insect. M. Latreille seems also to have discovered the cause of the shrill noise, made by crickets and grasshoppers. He supposes it to proceed from a musical instrument composed of a sort of drum or box, filled with air, and laying on each side at the lower part of the abdomen. On this drum, case, or violin, as it may be called, membranes are stretched which answer the purpose of strings, while the hinder thighs of the animal serve as bows. If M. Latreille has really made this discovery, it must be confessed that crickets, &c. are very ingenious little musicians, though their performances are neither very varied nor very agreeable, particularly where a great number of these violin players are collected together.

M. Savigny, another naturalist, waters of many situations on the rivers of the has already discovered twenty-two species in land and waters run into, and intersect each mile cows suffer most—any thing that will mile the subject of the subject of the cattle, the he has already discovered twenty-two species in land and waters run into, and intersect each mile cows suffer most—any thing that will mile the subject of the subject of the cattle, the mile cows suffer most—any thing that will mile the subject of the subject of the cattle, the mile cows suffer most—any thing that will mile the subject of the subject of the cattle, the mile cows suffer most—any thing that will mile the subject of the subject of the cattle, the mile cows suffer most—any thing that will mile the subject of the cattle, the mile that will be subject of the cattle, the mile the subject of the cattle, the mile the ca the vicinity of Paris. The family of creeping aniother in every variety of form; and as you pass tigate this evil, although it may not be perfectly up these noble waters the jutting and protecting effectual, will be useful. Eve- it was as early as about the tenth year, A. D., ry part of the Scripture, from the Flood to the as at that time the Romans had possession of crucifixion of our Saviour, mentions the vine as great part of this island, and had introduced the that no libations of wine should be made at fubeing held in the highest estimation. The book luxuries of Italy wherever they settled. Augus-nerals; and to encourage the pruning of vines, of Genesis informs us, that "Noah planted tus was then emperor, and it was common to he prohibited the use of any wines, in sacrifi-vineyards, and made wine." It is mentioned send the sons of the English nobles to Rome to ces to the gods, that were cut from vines which wineyards, and made wine." It is mentioned send the sons of the English nobles to Rome to among the blessings of the promised land, "a land of wheat, and barley, and vines," &c.

The answer of the vine to the trees in Jotham's have been neglected at this time, though many parable, shows in what high esteem men held authors are of opinion that the vine was not Ardea, in their wars against the Latins, for no my wine, which cheereth God and man, and go agricultural pursuits in all the provinces under to be promoted over the trees?"

Again, we are informed that the planting of present in scripture the flourishing state of a na-vineyards in Italy had so much increased about tion, a tribe, or a family, under the emblem of a vine. "Thou hast brought a vine out of Egypt, thou hast cast out the heathen, and planted it; thou preparedst room before it, and office the state of the st planted it; thou prepareds room before it, and in Italy, and ordered at least one half of those didst cause it to take deep root, and it filled the in the provinces to be cut down. It therefore the rivers Rhine, Maine, and Moselle; and in land." Pealm lawy Again the Psalmist men appears highly improbable that the vine should land." Psalm lxxx.—Again the Psalmist men-appears highly improbable that the vine should Hungary. tions it, "Thy wife shall be as the fruitful vine, not have been planted in Britain previous to the upon the walls of thine house."

That we are indebted to the Romans for the such fruit as appears almost incredible to our Bacchus was sometimes represented as an infant holding a cluster of grapes with a horn, and he has often been depicted as an old man, whose head was encircled with the vine, to teach us that wine taken immoderately, will enervate us, consume our health, and render us loquacious and childish, like old men.

Juno's crown was also made of the vine. The vine, with grapes, is still selected as a proper ornament in all bacchanalian devices.

Wine was chiefly used by the ancient Romans in the worship of their gods. Young men under thirty, and women all their lifetime, were forbidden to drink wine. Egnatius

Although wine is not made in Egypt, vines are much cultivated, and the grapes have a de-Plato, who strictly restrains the use of wine, licious perfume: the greater part of those that

Plato, who strictly restrains the use of wine, and severely censures the excess, says that "nothing more excellent or valuable than wine was ever granted by God to man:" the greater there, are of that species, of which the fruit contains only a single seed.

The leaves of the vine are of great utility in the kitchens of Egypt: they serve to envelop large balls of hashed meat, one of the dishes been the first who diluted wine with water; and on this account the fable was invented of they are frequently sold at a dearer rate than the properties of the greater part of those that are eaten there, are of that species, of which the fruit contains only a single seed.

The leaves of the vine are of great utility in the kitchens of Egypt: they serve to envelop large balls of hashed meat, one of the dishes most commonly presented at good tables. It is necessary that the leaves should be young: and they are frequently sold at a dearer rate than the greater part of those that are eaten there, are of that species, of which the fruit contains only a single seed.

The leaves of the vine are of great utility in the kitchens of Egypt: they serve to envelop large balls of hashed meat, one of the dishes most commonly presented at good tables. 114 feet in length, which in one year, produced two thousand and two hundred bunches of dial, in the year 1300. I am of opinion, that it grapes, each weighing, on an average, a pound. grapes, each weighing, on an average, a pound. was Portugal wine only which the apothecaries His late revered Majesty enjoyed the fruit of sold, and not foreign wine in general, for about this vine half a century. Fruit was the only that time we find that the merchants of Gascoin freedom of the city, are not to sell, by retail, wines or other wares, within the city or suburbs. Witness the King, at York, the eighth day of

The suppression of all the monastaries in that it ripened two thousand bunches of grapes towards the loss of our vineyards; and the present high duties on wine could not have been anticipated by our forefathers, when they neg-

lected their vines.

The first duty on wines was one penny per ton, which was in the year 1272, when wine gaugers were first appointed at London and the principal sea-ports. The new gauge duty at London alone amounted to fifteen pounds six-The new gauge duty at teen shillings and sevenpence, which makes the quantity imported amount to 7,598 pipes. The Thomas Leicester, amongst other charges, with principal customs for importation, at that period, seem to have been on wines chiefly French and Rhenish, as there is yet scarcely any mention of Spanish, or Portuguese, or Italian wine. (Madox's History of the Exchequer.)

In the year 1409, the duty on wine was three shillings per ton.

the same fruit in the south of France, and yet the making of wine even for the consumption of the island has never been attempted.

There are several accounts of actual vine-yeards being in England in an early period of our listory. Vineyards are noticed in the Doomsyear 1560. Strype, in his Life of Grindall, Bish-

Pliny mentions a vine, in his time, that was day Book, as also by Bede, as early as the com- op used every year to send her Majesty a pre-

of years old; and Miller states, that the vine-mement of the eighth century.

yards in some parts of Italy hold good above three hundred years.

It is related, that Rhemnius Palamon, who let y, shortly after the Conquest, appears to let y, shortly after the Conquest, appears to so in the earliest times. The prediction of Isai.

The Spaniard, during the vintage, throws off his stateline ss and his cloak, and cries out to his servants, "Let us be merry, my companions;

wisdom is fled out of the window."

The various wines made from the juice of the grape are so numerous, that to give a short description of each would be to write a voluminous work, and could only be interesting to those who are in the wine trade. Pliny says, there were eighty kinds of the best wines in his

The Grecians were renowned for their wines. Homer has celebrated several: among them, the kind called Maronean wine, which was made from grapes growing upon the coast of Africa; and also the Pramnian wine, which, according

the temple of Cybele.

These wines were so rare and expensive in Rome, in the younger days of Lucullus, that only one draught was allowed at a repast, however sumptuous the feast was in other respects. Lucullus says, that "he never saw at his father's board Greek wines served up but once at a meal; but when he returned from Asia, he gave to the people a largess of more than 100,000 gallons of

who wrote in the fourth century, to show of what wines the Britons had knowledge at that

early time.

Ye shall have rumney and malespine, Both ypocrasse and vernege wyne, Mountrese and wyne of Greek, Both algrade and despice eke; Antioche and Bastarde, yment also, and garnarde, Wyne of Greke and Muscadell, Both clare, pyment, and Rochell.

Some of these liquors, as ypocrasse, pyment, and clare, were compounded of wine, honey, and spices.

At the installation feast of George Neville, Archbishop of York, and Chancellor of England, amongst other liquors is mentioned, "In ale, 300 tun; in wine, 100 tun; in ipocrasse, 1

pipe."
In the year 1311 we find Thomas Earl of Lei-£104. 178. 6d. for 369 pipes of red wine and two pipes of white, which is about 5s. 73d. per pipe.

consists of poisonous drugs: indeed it would have been more honourable to have analyzed the wines of any suspected person, and to have exposed them to the public, were they guilty of so injur-ing the constitutions of their benefactors. A winc-merchant seldom does more himself to the the 25th and 51st degree in the northern hemisfinings of his wines than to give directions to his phere, cellar-man: were he to use pernicious finings, It has been observed, that all the vineyards in how often should we hear of his being betrayed Germany, beyond the 51st degree, are dubious.

by his discharged servants!

For red wines, the whites of eggs, with some-times a part of the shells pulverized, is the universal and only finings used. A few years back, ry, the wine-merchants discharged the colour with the assistance of a small quantity of new milk. The folly of this fashion was no sooner seen, than good brown sherries returned into falime plaster, while the Greeks of the same day the juice of our own grapes is erroneous: I have quickened their's with clay and marble powder-tasted it quite equal to the Grave wines; and in quickened their's with clay and marble powdered, or with sea water.

The Romans admired the flavour of pitch, which was often added to their wines; thus we find it has ever been the study of the wine-merchant to suit the taste of the times, but at no keeping. period has it been found necessary to add baneful

drugs.

Grapes furnish the French with another article of commerce, almost equal in importance to their produce a good beverage. wines; namely, brandy. It is computed that their The following observations on the economical exportation in this liquor is not less than 50,000 uses to which the leaves and stalks of the vine

The brandies imported into this country are principally from Bordeaux, Rochelle, and Cogbrandies are originally white, but by long keeping they naturally become a little stained by the other dyes are added to such an excess, as to destroy the natural flavour of the spirit.

Private families would do well to buy none but

The fruiterers of London have a considerable trade in preserved grapes, which are principally brought from Portugal in large earthen jars, closely cemented down: these grapes add considerably to the luxury of our winter desserts, as they are sold at moderate prices for so rare a fruit.

This art of preserving grapes was well known to the Romans. Columella gives a particular account of the manner they were preserved, both in his time, and in the time of his uncle Marcus vine were eaten as a pickle by the Romans. Columella. He recommends them to be put into small jars that will only contain one bunch, and that the fruit should be quite dry, when the sun remedy for bruises. is on it, and after being cooled in the shade, to be The wood of the suspended in the jars, and the vacua to be filled used by painters for drawing outlines, and is menup with oat chaff, after all the dust has been blown from it. The jars must be well baked or burned, and not such as imbibe moisture; the tops of the jars must be covered over, and pitched, to keep out the air.

The process of drying grapes into raisins is

usually performed, by tying two or three bunches together before they are cut from the vine, and to be good, and suitable to the situation and soil dipping them into a hot lixivium of wood ashes, in which they are to be placed. with a little olive oil in it : they then shrivel, and

an opportunity to analyze it, and ascertain if it finest raisins from Damascus. Sun raisins are brought from Spain, and are so called to distinguish them from those that are scalded, or dried. in ovens. Large quantities are also imported from Malaga, Calabria, Muscadine, Smyrna, &c.

The vinous latitude is said to extend between

It has been observed, that all the vineyards in This leaves the southern coast of England within the latitude for vines; and I have often been surprised that the culture of them should have been so little attended to, where the shelter of the when there was so great a demand for pale sher-hills, and the soil, seem to offer so promising a beck, that produced sixteen different sorts of situation.

There are several flourishing vineyards at this time in Somersetshire; the late Sir William Basset, in that county, annually made some hogsheads your. The Africans of old used to mitigate and of wine, which was palatable and well bodied. allay the tartness of their wines with a kind of The idea that we cannot make good wine from some instances, when kept for eight or ten years, it has been drunk as Hock by the nicest judges. Grapes that are not perfectly ripe, and even sour, will make good wine, but it will require longer

If a sweet wine be preferred, raisins should be used with the grapes; for sugar and water (the common addition to our country wines) can never

not avoid giving a few remarks on a fruit of so much importance.

In the planting of vines, the first care should be to select cuttings of those kinds which are known

" The grafting of vines upon vines is not now

ways: the first was insition, which is the ordinary manner of grafting; the second was terebration through the middle of the stock, and putting in the scions there; and the third was pairing of two vines, that grow together, to the marrow, and binding them close.

Speechly, in his work on the vine, says, "The grafting of grapes is but little attended to, although of so much importance; as a bad vine may be improved without loss of time;" and he states, that he has had fine grapes from the same year's grafts, which, if permitted, will run from thirty to forty feet the first summer. He mentions a vine of the Syrian kind, in a hothouse at Welgrapes from as many graftings.

Vines have ever been found to thrive best on the banks of rivers, or where their roots can draw

moisture in abundance.

The scripture often makes the remark: " It was planted in a good soil by great waters, that it might bring forth branches, and that it might bring forth fruit, that it might be a goodly vine." (Ezekiel, c. xvii. v. 8.)

"Thy mother is like a vine in thy blood, plant-ed by the waters: she was fruitful and full of branches, by reason of many waters." (Ezekiel,

c. xix. v. 10.

It hath been stated, that the blood of animals, applied about the roots, greatly nourishes the vine; this must be owing to the quantity of saline particles which it contains.

Mr. Daws, of Slough, near Windsor, has made the experiment of painting one half of a wall pipes or pieces per ann. which, at the average of hive shillings per gallon, produces them nearly two millions sterling annually.

may be applied, are taken from a letter in the black, that was covered with a vine, and leaving the other half in its common state. That part of the vine which covered the black wall, ripened the grapes earlier, and yielded about three times

Gentlemen, who prune their own vines, should observe, that the fruit is always produced upon the bearing shoots for the following year cannot leaving too many, the vine is exhausted, and yields but poor small fruit. The shoots just above the fourth eye are to be cut, and the cutting the bud to injure it. About the beginning of Vine-leaves, as well as the tendrils, have an May, all vines should be looked over, and the shoots from the old wood should be rubbed off; and if one eye produces two shoots, the weakest quiring refrigerant and styptic medicines. The must be removed, Vines require frequent eximice or sap of the vine, called lachyrma, has been recommended in calculous disorders, and shoots; and about the latter end of June, the ends is said to be an excellent application to weak eyes of the bearing branches are to be nipped off, but and specks of the cornea. The tendrils of the those intended for the next year's fruit, may go a month longer before they are topped.

The blossoms of the vine have an agreeable

wine, to give it this fragrance.

The Romans reared their vines by fastening them to certain trees, as the poplar and the elm, &c., whence these trees were said to be married Although it forms no part of my plan in this to the vines, which gave rise to that elegant and work to enter upon the cultivation of trees, I canmona.

> If that fair elm," he cried, "alone should stand, No grapes would glow with gold, and tempt the hand:

Or, if that vine without herelm should grow, Twould creep a poor neglected shrub below."

partly dry; and in a few days they are cut from in use," says Lord Bacon in his Natural History; Pliny states that the vines in Italy would climb the vine, and dried in the sun. We procure the and adds, "the ancients had it, and that three to the very top, and even out-top the highest pop-Pliny states that the vines in Italy would climb

Selections from late numbers of the London Farmers' Journal, received at the office of the American Farmer.

ON THE PRESENT STATE OF AGRI-CULTURE.

Kendal, May 16th, 1822.

SIR, Several accounts have been published on the great depression in the value of the productions of the soil of this kingdom. The following tables will exhibit the subject in such a manner as 25 acres, in the former period, still the rent is small twigs at top, to plant for timber? Then how should apple trees, which are trained like entirely sunk. We may observe that this despression is not solely confined to grain; but from the prices of the necessaries of life, continuing for so long a time together, deserve to be recorded in the Journal of the first table we perceive that all the productions are trained like whip sticks, be likely to swell properly in the first table we perceive that all the productions are trained like whip sticks, be likely to swell properly in the first table we perceive that all the productions are trained like whip sticks, be likely to swell properly in the first table we perceive that all the productions are trained like whip sticks, be likely to swell properly in the first table we perceive that all the productions are trained like whip sticks, and the same trained like whip sticks are trained like w gether, deserve to be recorded in the Journal of

Comparative statement of the London markets and November, 1821.

	F		rua 814	ry,		1	No		mber 21.	r,	in value per cent		
\$7 N -	s.	d.		s.	d.	s.	d.		s.	d.	£.		
Beef	5	0	to	.7	0	2	4	to	3	10	48		
Mutton	6	0	to	8	0	2	4	to	3	10	36		
Lamb .	6	6	to	8	0	4	0	to	4	6	44		
Veal	8	0	to	10	0	3	6	to	5	6	50		
Pork	6	8	to	8	8	2	6	to	5	0	50		
Bacon .	8	4	to	8	8	3	4	to	4	0	53		
Potatoes	70	0	to	130	0	40	0	to	120	0	20		
Hay	80	0	to	105	0	45	0	to	90	0	18		
Clover .	100	0	to	147	0	50	0	to	110	0	31		

From this Table it apperas that the price of Beef has decreased 48 per cent. or near one half. Mutton 56 per cent., that is more than one half .-Veal and Pork 50 per cent., or one half. Bacon 53 per cent. being more than one half; and in Potatoes, Hay, and Clover, also a considerable decrease; and the total average reduction on the above articles is upwards of £41 per cent. or nearly one half of the value. Can, or ought this state of things continue? I think not, though perhaps they may be borne a little longer.

Comparative state of London markets in the prices of Grain and Bread

I am, Sir, Your's obediently, JOHN SWAINSTON.

PEELING AND BARKING FRUIT TREES

This subject has been several times mentioned by query or otherwise, in our columns, and being very interesting in its nature, we take the oppor-tunity that is afforded us by the receipt of Mr. corrugates and becomes a dead colour, and bound; Lyon's Treatise, to give some further information thereupon. In doing this, we purposely pass over all the previous reasoning in the treatise itself, as being wholly extraneous to the practical question; to enter into a controversy with the peeled trees at all ages with advantage, (that is, author, either on the physiology of plants, or on we suppose, trees which were nursery raised,) author, either on the physiology of plants, or on the agricultural application of his principles, is and it must be obvious that in an early stage, no part of our design. Our opinion on the whole of this introductory reasoning (though many parts of it are ingenious) is, that if the author had confined his work to the cause and cure of canker, it would have been an admirable practi- peeling must be deep, and done with cutting incal essay.

There is a story told of an Indian in Pennsyltrees should grow."-In this answer of the In- extracts from Mr. Lyon's Treatise :dian, there is probably more good sense than some

lars; on which account, the grape gatherers, in that a reduction of rents would be sufficient to practices; wall-fruit we must have, but training time of vintage, put a clause in the covenant of relieve the country. This is fallacious, for how superinduces pruning for all that; and standards their bargains, when they were hired, that in case is it possible there can be any reduction equal to their foot should slip and their necks be broken, this depreciation in value? From the above reason of the value of the land; but this does their masters should give orders for their funeral comparison it is clearly shown the whole rent is not prove that the method is not injurious to the gone. I will state a case to illustrate the matter future growth of the trees; in fact, in many ca-
